Preface

Welcome to the *NVIDIA Mission Control Manual* for NVIDIA Base Command Manager 11.

0.1 About This Manual

The NVIDIA Mission Control features of NVIDIA Base Command Manager (BCM) are available on clusters that are running the NVIDIA Mission Control edition of BCM. The features are listed in chapter 1 of this manual.

This manual is aimed at helping cluster administrators install, understand, configure, and manage the NVIDIA Mission Control features and capabilities of NVIDIA Base Command Manager. The administrator is expected to be reasonably familiar with the *BCM Administrator Manual*. The *NVIDIA Mission Control Manual* is thus a supplementary manual to the *BCM Administrator Manual* for the NVIDIA Mission Control features.

0.2 About The Manuals In General

Regularly updated versions of the manuals are available on updated clusters by default at `/cm/shared/docs/cm`. The latest updates are always online at <https://docs.nvidia.com/base-command-manager>.

- The *Installation Manual* describes installation procedures for the basic cluster.
- The *Administrator Manual* describes the general management of the cluster.
- The *User Manual* describes the user environment and how to submit jobs for the end user.
- The *Cloudbursting Manual* describes how to deploy the cloud capabilities of the cluster.
- The *Developer Manual* has useful information for developers who would like to program with BCM.
- The *Edge Manual* explains how BCM can be used with edge sites.
- The *Containerization Manual* describes how to manage containers with BCM.

If the manuals are downloaded and kept in one local directory, then in most pdf viewers, clicking on a cross-reference in one manual that refers to a section in another manual opens and displays that section in the second manual. Navigating back and forth between documents is usually possible with keystrokes or mouse clicks.

For example: <Alt>-<Backarrow> in Acrobat Reader, or clicking on the bottom leftmost navigation button of xpdf, both navigate back to the previous document.

The manuals constantly evolve to keep up with the development of the BCM environment and the addition of new hardware and/or applications. The manuals also regularly incorporate feedback from administrators and users, who can submit comments, suggestions or corrections via the website

<https://enterprise-support.nvidia.com/s/create-case>

Section 14.2 of the *Administrator Manual* has more details on submitting an issue.

0.3 Getting Administrator-Level Support

If the reseller from whom BCM was bought offers direct support, then the reseller should be contacted.

Otherwise the primary means of support is via the website

<https://enterprise-support.nvidia.com/s/create-case>

Section 14.2 of the *Administrator Manual* has more details on working with support.

0.4 Getting Professional Services

The BCM support team normally differentiates between

- regular support (customer has a question or problem that requires an answer or resolution), and
- professional services (customer asks for the team to do something or asks the team to provide some service).

Professional services can be provided via the NVIDIA Enterprise Services page at:

<https://www.nvidia.com/en-us/support/enterprise/services/>

1 Introduction

1.1 NVIDIA Mission Control Requirements And Features

The NVIDIA Mission Control features are extended features that are only available in the NVIDIA Mission Control edition of NVIDIA Base Command Manager (BCM). NVIDIA Mission Control features are targeted at NVIDIA B200, GB200, and other OEM platforms. The NVIDIA sales team must be contacted in case an NVIDIA Mission Control edition is required.

The NVIDIA Mission Control features of the NVIDIA Mission Control edition of BCM can be enabled on a BCM cluster with an active BCM license. Activation of the BCM license is described in Chapter 4 of the *Installation Manual*.

1.1.1 NVIDIA Mission Control Features

The NVIDIA Mission Control edition is capable of running the following:

- NVIDIA-conforming BMS: a *Building Management System* software that aids in cluster management in the building.
- Leak detection: monitoring for leak detection in the fluid-cooled processors. Associated with this are the possible automated actions taken.
- Autonomous hardware recovery:: Automates some hardware management operations in order to keep the cluster up.
- NMX: Product suite name for HPC cluster network monitoring and management system that comprises NMX Telemetry, NMX Manager, NMX Controller and NMX Oasis.
- IMEX (Internode Memory Exchange Service): a secure service that facilitates the mapping of GPU memory over NVLink between the GPUs in an NVLink domain. IMEX configuration is described in section 7.5.1 of the *Administrator Manual* as part of workload management configuration.
- GB200 rack management: Automated management of rack power up and power down sequence.
- GB200 firmware management: GB200 firmware and BIOS management.
- Power reservation steering: Predicting power consumption, and capping the power to active components based on that prediction, to reduce data center energy costs.
- Run:ai: Kubernetes-based workload management and orchestration via Run:ai.

1.1.2 Checking That The NVIDIA Mission Control Edition Is Running

Whether the NVIDIA Mission Control edition is running on the cluster can be checked:

- in `cmsh`:

- using the `licenseinfo` command within `cmsh`

Example

```
root@basecm11:~# cmsh -c 'main licenseinfo | egrep Version\|Edition'
Version                                10 and above
Edition                                NVIDIA Mission Control
```

or

- using the `verify-license` utility from a command line:

Example

```
root@basecm11:~# verify-license info
===== Certificate Information =====
Version:                                10
Edition:                                NVIDIA Mission Control
...
```

or

- using the `editiondisabledfeatures` command.
 - * If the NVIDIA Mission Control edition is running, then the features are all available, as indicated by:

Example

```
root@basecm11:~# cmsh -c 'main editiondisabledfeatures'
No disabled features
```

- * If the NVIDIA Mission Control edition is not running, then the features are not available, as indicated by:

```
root@basecm11:~# cmsh -c 'main editiondisabledfeatures'
LeakDetection
DisplayRack
RackPower
NGG
APS
Firmware
NVIDIA-conforming BMS
Run:AI
IMEX
NMX
PRS
```

- in Base View the status of the NVIDIA Mission Control features is indicated by the navigation path:
Cluster>License Information>NVIDIA Mission Control Attributes

2 NMX Settings For NVLink Monitoring

2.1 Introduction

NMX is a product suite for HPC cluster network monitoring and management. The system is made up of:

- NMX Telemetry
- NMX Manager
- NMX Controller
- NMX Oasis

The NVIDIA Mission Control edition of BCM can monitor NMX telemetry services that run on:

- NVLinks (direct GPU interconnection within a server)
- NVLink switches (direct GPU interconnection across servers)

2.2 NMX Metrics In BCM

NMX service authentication settings can be configured from within `partition` mode, within the `nvmsettings` submode:

```
[basecm11->partition[base]->nmxmsettings]% show
Parameter                                Value
-----
Revision
Server                                  10.140.0.41
User name                               rw-user
Password                               *****
Port                                    443
Verify SSL                             no
```

After BCM has provisioned the NMX Controller and the NMX Telemetry services on the NVSwitches, then the `sample_nmxm` data producer produces the NMX measurables. These can be viewed from `partition` mode:

Example

```
[basecm11->partition[base]]% latestmetricdata| head -2; latestmetricdata| grep nm
Measurable                               Parameter                               Type    Value  Age    State Info
-----
nmxm_chassis_count                       NMX-M  9      30.9s
nmxm_compute_allocation_count            all      NMX-M  54     30.9s
nmxm_compute_allocation_count            free     NMX-M  48     30.9s
nmxm_compute_allocation_count            full     NMX-M  6      30.9s
nmxm_compute_allocation_count            partial  NMX-M  0      30.9s
nmxm_compute_health_count                 degraded NMX-M  0      30.9s
nmxm_compute_health_count                 healthy  NMX-M  0      30.9s
nmxm_compute_health_count                 unhealthy NMX-M  6      30.9s
nmxm_compute_health_count                 unknown  NMX-M  63     30.9s
nmxm_compute_nodes_count                 NMX-M  69     30.9s
nmxm_domain_health_count                  degraded NMX-M  0      30.9s
nmxm_domain_health_count                  healthy  NMX-M  0      30.9s
nmxm_domain_health_count                  unhealthy NMX-M  0      30.9s
nmxm_domain_health_count                  unknown  NMX-M  3      30.9s
nmxm_gpu_health_count                     degraded NMX-M  0      30.9s
nmxm_gpu_health_count                     degraded_bw NMX-M  0      30.9s
nmxm_gpu_health_count                     healthy  NMX-M  0      30.9s
nmxm_gpu_health_count                     nonvlink NMX-M  24     30.9s
nmxm_gpu_health_count                     unknown  NMX-M  16     30.9s
nmxm_gpus_count                           NMX-M  40     30.9s
nmxm_ports_count                          NMX-M  152    30.9s
nmxm_switch_health_count                  healthy  NMX-M  0      30.9s
nmxm_switch_health_count                  missing_nvlink NMX-M  8      30.9s
nmxm_switch_health_count                  unhealthy NMX-M  0      30.9s
nmxm_switch_health_count                  unknown  NMX-M  0      0.9s
nmxm_switch_nodes_count                  NMX-M  46     30.9s
```

2.3 NMX Manager Metrics Forwarding Via BCM And prometheusmetricforwarders

Prometheus servers can be used to pick up NMX Manager metrics via Prometheus exporters. However in a typical BCM configuration, such as in a BCM type 1 network (section 3.3.9 of the *Installation Manual*), the Prometheus exporter is behind the BCM head node firewall. This means that by default an external Prometheus server cannot reach the exporter endpoint.

In such a case the `prometheusmetricforwarders` submode can be used to define the endpoint URL and HTTP method that the exporter uses. This forwards the exporter endpoint to the external network interface of the head node. The external Prometheus server can then reach the forwarded exporter endpoint.

Example

```
[basecm11->partition[base]->nmxmsettings->prometheusmetricforwarders[all]]% show
Parameter                               Value
-----
Name                                     all
Revision
Urls                                     http://10.140.0.41:9091/metrics
Method                                   GET
```

3 Rack Management

3.1 Introduction

Rack management is the process of using tools and software to organize and manage the infrastructure components and racks in a data center.

A DGX GB200 system can be thought of as a “disaggregated supercomputer in a rack”. The cluster administrator can manage the individual nodes in the traditional way, but BCM rack management features introduced in BCM version 11 allow the GB200 nodes to be managed more conveniently as unified NVL domains.

3.2 Basic Rack Management

Basic rack management is covered in section 3.15 of the *Administrator Manual*. The commands in rack mode that are discussed there include:

- The `list` command, which can give useful information on how the devices in racks are organized, if the attributes of racks in rack mode have been set up in a meaningful way. An example is given in section 4.8.1.
- The `display` command, which is useful for seeing the position of where devices are located in the rack, if the cluster administrator has recorded the device positions in the rack. An example is given in section 4.8.3.
- The `addrackposition` command (page 172 of the *Administrator Manual*) was introduced in BCM version 11. It allows rack positions in a cluster to be filled more easily than with a looping script.
- The `rackoverview` command (page 168 of the *Administrator Manual*) was also introduced in BCM version 11. It allows rack positions in a cluster to be overviewed conveniently. It shows information about the types of entities in a rack. It also then lists some more detailed information about some of the entity types.

For a DGX GB200 platform that has been configured, the output of the `rackoverview` command looks similar to the following for a specified rack (here it is a rack named `b05` that has 18 nodes, 9 switches, and 8 power shelves):

Example

```
[a03-p1-head-01->rack]% rackoverview b05
```

Type	Up	Down	Closed	Total
Nodes	18	0	0	18
DPU nodes	0	0	0	0

3.3 Advanced Features In Rack Management

Over time, clusters have become more powerful and their cooling requirements have become more demanding. Liquid cooling technology has therefore become more common over time.

The monitoring associated with liquid cooling has also developed. Monitoring of the electrical supply, fans, component temperatures, and coolant values such as flow and pressure has become popular. Coolant monitoring in BCM includes an ability to detect leaks and then take actions.

This section describes some of the rack mode commands in BCM that can help the cluster administrator with an overview of monitoring values, including values associated with liquid cooling.

3.3.1 The `electricaloverview` Command

The `electricaloverview` command within rack mode gives a convenient overview of the electrical supply to the cluster. The power used and the power budget of a specified rack (B05 in the following example) can be seen:

Example

```
[basecm11->rack[B05]]% electricaloverview
```

Rack	Power used	Power budget	Isolation status
B05	28.5 kW	135 kW	0

If no rack is specified, then the command displays the information for all racks.

3.3.2 The `liquidcoolingoverview` Command

The `liquidcoolingoverview` command within rack mode conveniently displays coolant metrics:

```
[basecm11->rack]% liquidcoolingoverview a05
```

Rack	Supply temperature	Return temperature	Flow rate	Differential pressure	Isolation status
A05	26.03 C	30.78 C	70.938 LPM	31 KPa	0

If no rack is specified, then the command displays the information for all racks.

3.3.3 The `leakdetectionoverview` Command

The `leakdetectionoverview` command within rack mode gives a convenient overview about sensor readings related to leak detection in BCM and BMS. BMS (Building Management System) is a software used to manage IT assets in a building, and is used by BCM internally.

The output from the command applied to a specific rack looks similar to the following:

```
[basecm11->rack]% leakdetectionoverview a05
```

Rack	Leak detected	Leak tray detected	Leak sensor fault	Liquid isolation request (BCM)	Liquid isolation request (BMS)	Liquid isolation status	Electrical isolation request (BCM)	Electrical isolation request (BMS)	Electrical isolation status
A05	0	0	0	0	0	0	0	0	0

```
[basecm11->rack]%
```

If no rack is specified, then the command displays the information for all racks.

3.3.4 The leakinfo Command

The `leakinfo` command is related to leakage detection, but it is not a rack mode command. It is a device mode command. It is noted in this section for completeness. It can be run at device mode level to list all leaks detected in the cluster.

Typically, and ideally, running the command shows something similar to:

```
[basecm11->device]% leakinfo
Hostname          Timestamp Severity  Info
-----
[basecm11->device]%
```

If there are issues on the devices, then the output may look similar to::

```
[basecm11->device]% leakinfo
Hostname          Timestamp Severity  Info
-----
a05-dgx-01-c09    15:09:23   large    The state of resource `Chassis_0_LeakDete...
a07-dgx-03-c16    15:38:48   large    The state of resource `Chassis_0_LeakDete...
b05-dgx-05-c08     09:11:06   large    The state of resource `Chassis_0_LeakDete...
b05-dgx-05-c10     09:11:05   large    The state of resource `Chassis_0_LeakDete...
b06-dgx-06-c17    11:49:30   large    The state of resource `Chassis_0_LeakDete...
[basecm11->device]%
```

Running `help leakinfo` lists further command options.

3.3.5 The isolationrequestinfo Command

If a leak is detected, then BCM receives the report. BCM then:

- powers off the node that is leaking
- powers off the rack if multiple nodes are leaking
- isolates the rack to prevent other nodes suffering the same fate

Isolation means that power no longer runs through the leaking racks.

The isolation status of a rack can be viewed with the `isolationrequestinfo` command, which normally shows something similar to:

Example

```
[basecm11->rack]% isolationrequestinfo
Rack          Timestamp    Kind      Value      Info
-----
[basecm11->rack]%
```

During a leakage event, the output may show something similar to:

Example

```
[basecm11->rack]% isolationrequestinfo
Rack  Timestamp  Kind  Value  Info
-----
B05   03:40:01   4     Default building policy/Rack
[basecm11->rack]%
```

3.3.6 Managing Leaks With rules In leakactionpolicies

The cluster administrator has the freedom to construct actions based on triggers based on leak detection measurables. While that is powerful, that can be quite labor-intensive for cluster administrators.

BCM provides a simpler way to deal with leaks, based on leak action policies. Leak action policies are a collection of rules that carry out actions to be followed with leaks are detected. Racks play an important part in these policies and rules.

The policies use predefined scopes, or groupings. The names of these groupings are rules. The groupings are listed next, in order from largest to smallest, along with their associated descriptions:

- **Building:** a building is made up of rooms
- **Room:** A room has rows of racks in it.
- **Row:** A row of racks has individual racks in it.
- **Rack:** An individual rack has devices in it.
- **Device:** The smallest possible grouping

The policies can be listed in the `leakactionpolicies` submenu, under `partition` mode.

Example

```
[basecm11->partition[base]->leakactionpolicies]% list
Name (key)          Rules
-----
Default building policy  Building, Device, Rack, Room, Row
Default device policy    Device
Default rack policy      Device, Rack
Default room policy      Device, Rack, Room, Row
Default row policy       Device, Rack, Row
```

The rules used by each policy are also shown, under the Rules column in the preceding example.

Each rule in a policy is a copy of a template. By default the rules per policy are identical.

Just the rules used by a specific policy can also be viewed:

Example

```
[basecm11->partition[base]->leakactionpolicies]% use default building policy
[basecm11->partition[base]->leakactionpolicies[Default building policy]]% show
Parameter          Value
-----
Name                Default building policy
Revision
Rules               Building, Device, Rack, Room, Row
```

Within a policy, the value of the settings for these rules can be listed:

Example

```
[basecm11->...leakactionpolicies[Default building policy]->rules]% list
```

Name (key)	Scope	Power off	Power off rack	Electrical isolation	Liquid isolation	Minimal devices	Maximal devices
Building	building	yes	yes	no	no	11	100000
Device	device	yes	no	no	no		
Rack	rack	yes	yes	yes	yes	3	100
Room	room	yes	yes	no	no	7	100000
Row	row	yes	yes	no	no	5	100

The rules for each policy can be modified independently for each policy, so that, for example the Rack rule values may differ between `Default row policy` and `Default building policy`. However, a sensible cluster administrator is not expected to carry out such a modification.

Another way of phrasing this is: The values of the rules can be changed from the defaults. In that case, a sensible administrator is expected to keep the values synchronized across the rules in the leak action policies.

In the preceding example:

If the minimal devices criterion is met for leaking for each rule in a policy, then the values for the column header are applied to the rules of that policy.

So, for the policy rules in the preceding example, when leaking is detected:

- If only one or two devices are detected as leaking, then only the devices involved are powered off.
- If, in one rack, more than 3 devices, but less than 5 devices, are detected as leaking, then in addition to the device rules being applied, the entire rack is powered off. Isolation is also carried out for the electrical power and liquid coolant.
- If more devices meet the conditions, so a larger scope is affected by leaking, then the rules for the larger scope are also applied.

The rules for a specific policy can be removed. The row rule for `Default building policy` can be removed with, for example:

```
[basecm11->partition[base]->leakactionpolicies[Default building policy]]% rules
[basecm11->...leakactionpolicies[Default building policy]->rules]% remove <TAB><TAB>
building device rack room row
[basecm11->...leakactionpolicies[Default building policy]->rules]% remove row; commit
```

Custom Rules For leakactionpolicies

The names for the rules (Device, Rack, Row ...) are really just default labels, and a sensible cluster administrator is expected to have the description associated with the name match the physical reality. Creating a custom rule may help with this.

Custom rules can be added by the cluster administrator, by first adding another policy:

```
[basecm11->partition[base]->leakactionpolicies[Default building policy]]% add mypolicy
[basecm11->partition*[base*]->leakactionpolicies*[mypolicy*]]% list
Name (key)          Rules
-----
Default building policy Building, Device, Rack, Room, Row
Default device policy Device
Default rack policy Device, Rack
Default room policy Device, Rack, Room, Row
Default row policy Device, Rack, Row
mypolicy            none
[basecm11->partition*[base*]->leakactionpolicies*[mypolicy*]]% show
Parameter          Value
-----
Name                mypolicy
Revision
Rules               none
```

By default, there are no rules in the new policy:

```
[basecm11->partition*[base*]->leakactionpolicies*[mypolicy*]]% rules
[basecm11->partition*[base*]->leakactionpolicies*[mypolicy*]->rules]% list

Name (key)  Scope      Power off  Power off rack  Electrical  Liquid  Minimal  Maximal
-----
isolation  isolation  devices   devices
```

The cluster administrator may have a testing room in which to keep a rack. In that case, the following might be added:

```
[basecm11->partition*[base*]->leakactionpolicies*[mypolicy*]->rules]% add testroom
[basecm11->partition*[base*]->leakactionpolicies*[mypolicy*]->rules*[testroom*]]% show
Parameter          Value
-----
Name                testroom
Revision
Scope              rack
Disabled            no
Minimal devices     1
Maximal devices     100
Grace period        0s
Correlation window  5m
Power off           yes
Power off rack      no
Electrical isolation no
Liquid isolation    no
Minimal severity    1
Maximal severity    100
```

Adding a rule adds a default with the preceding rack-based rule values.

The rule values can be modified using the set command.

Running set without any options provides a help text explaining what can be set:

```
[basecm11->partition*[base*]->leakactionpolicies*[mypolicy*]->rules]% set
```

3.4 Building Management System And CMDaemon

3.4.1 Introduction To How BMS And BCM Work Together

A Building Management System, (BMS) software that is capable of integration with BCM, is known as a *conforming BMS*. The conformance is to a reference design for data center planning (NVIDIA Controls and Monitoring Reference Design), available to some NVIDIA product users.

Since BCM version 11, BCM integrates with a conforming BMS for leak detection and control in the data center (DC). The implementation of the integration between BCM and a conforming BMS is also meant to serve as a guide to NVIDIA customers who may use different BMS solutions.

BCM communicates with a conforming BMS. Together they monitor the DC. The integration works with DGX GB200 systems that are liquid-cooled, as well as other systems.

In a DC, a conforming BMS is able to detect most of the detected leak-related events. The remaining detected leak-related events, from the in-tray BMCs (compute tray and switch tray), are dealt with by BCM.

BCM uses the MQTT protocol for two-way communication with the conforming BMS, using a BCM service `cm-mqtt`.

The BMS sends BCM information about the inventory of the DC, and about the leak-related events it knows about (non-tray events). MQTT topics are created, and structured in a way that BCM can parse.

BCM in turn sends the BMS instructions on liquid management or power management, according to defined policies on events such as leaks or power outages (section 4.7).

3.4.2 Building Management System Configuration

BMS integration can be configured in BCM in partition mode in `cmsh` and Base View.

The BMS software type used can be configured in partition mode:

Example

```
root@basecm11:~# cmsh
[basecm11]% partition
[basecm11->partition[base]]% set bms nvidia
conforming
bms; confirm
```

The value set for `bms` can also be set to the URL of a BMS server, for example `http://bmserver/path`, and credentials for it can then be set:

Example

```
root@basecm11:~# cmsh
[basecm11]% partition
[basecm11->partition[base]]% set bms url
[basecm11->partition*[base*]]% set bmscertificate
[basecm11->partition*[base*]]% set bmspath http://bmserver/path
[basecm11->partition*[base*]]% set bmsprivatekey
[basecm11->partition*[base*]]% commit
```

In the following example, an `mqtt` role is assigned in the `mqtt` configuration overlay. The overlay specifies where the `cm-mqtt` service should run. In this case it runs on all the head nodes:

Example

```

root@basecm11:~# cmsh
[basecm11->partition[base]]% configurationoverlay
[basecm11->configurationoverlay]% add mqtt
[basecm11->configurationoverlay*[mqtt*]]% set allheadnodes yes

```

Within the role assignment, the administrator specifies the hostname or IP address of where the BMS server runs, and where the cm-mqtt service pulls data from:

```

[basecm11->configurationoverlay*[mqtt*]]% roles
[basecm11->configurationoverlay*[mqtt*]->roles]% assign mqtt
[basecm11->configurationoverlay*[mqtt*]->roles*[mqtt*]]% show
Parameter                               Value
-----
Name                                    mqtt
Revision
Type                                    MQTTRole
Add services                            yes
Servers                                <0 in submode>
CA certificate path                      /cm/local/apps/cmd/pythoncm/lib/python3.12/site-packages/\
pythoncm/etc/cacert.pem
Private key path                         /cm/local/apps/cmd/cm-mqtt/etc/mqtt.key
Certificate path                         /cm/local/apps/cmd/cm-mqtt/etc/mqtt.pem
Write named pipe path                   /var/spool/cmd/mqtt.pipe
[basecm11->configurationoverlay*[mqtt*]->roles*[mqtt*]]% servers
[basecm11->configurationoverlay*[mqtt*]->roles*[mqtt*]->servers]% list
Server (key)    Port    Disabled
-----
[basecm11->configurationoverlay*[mqtt*]->roles*[mqtt*]->servers]% add mqhost
[basecm11->configurationoverlay*[mqtt*]->roles*[mqtt*]->servers*[mqhost*]]% show
Parameter                               Value
-----
Revision
Server                                    mqhost
Port                                    1883
Topic                                    BCM/#
Disabled                                no
Username
Password                                < not set >
Transport                                tcp
Protocol                                v3.1.1
Certificate required                      yes
CA certificate
Certificate
Private key
[basecm11->configurationoverlay*[mqtt*]->roles*[mqtt*]->servers*[mqhost*]]% set certificate
...

```

A username, password, and service certificate can be set. These allow BCM to communicate with the BMS securely:

```

[basecm11->configurationoverlay[mqtt]->roles[mqtt]->servers[mqhost*]]% show
Parameter                               Value
-----
Revision
Server                                    mqhost
Port                                    1883
Topic                                    BCM/#
Disabled                                no

```

```

Username          cronus
Password          *****
Transport         tcp
Protocol          v3.1.1
Certificate required yes
CA certificate
Certificate
Private key
[basecm11->configurationoverlay[mqtt]->roles[mqtt]->servers[mqhost]]%

```

If the cluster manager has correctly established communication with the BMS, then the status of the BMS (metrics for power circuit, CDUs, electrical, and liquid cooling) can be seen from within cmsh (section 4.7).

Example

```

[basecm11]% powercircuit overview
Power circuit  Power      Current      Current limit  Current phase 1  Current phase 2 ...
-----
RPP-B12-3     14.0 KW    26.1118 A    0 A            17.7822 A       26.1118 A       ...
RPP-B14-3     15.3 KW    29.6178 A    0 A            17.7419 A       29.6178 A       ...
RPP-B21-5     7.5 KW     11.2255 A    0 A            10.4872 A       10.5412 A       ...
...

```

4 BCM Power Shelf Integration

The NVIDIA GB200 server platforms use power shelves to distribute power in racks. Several power shelves are used per rack. Each power shelf takes up one rack unit. Each power shelf is comprised of several PSUs (Power Supply Units).

The reference design for an NVIDIA GB200 rack has 6 power shelves, and uses 6 PSUs in each power shelf. Each PSU is rated up to 5.5kW, so that each power shelf is rated up to 33kW.

This chapter considers an NVIDIA GB200 server platform that has been configured to work with BCM.

4.1 Power Shelf Listing And Overview

The `list -t powershelf` command in device mode can be used to list the power shelves of a configured cluster

Power shelves are configured as devices on an IPMI network, as indicated by the following example (some rows ellipsized):

Example

```
[basecm11->device]% list -t powershelf
```

Type	Hostname (key)	MAC	IP	Network	Status
PowerShelf	B05-P1-PWR-01	00:18:23:0C:1E:90	7.241.1.47	ipminet1	[UP]
...					
PowerShelf	B05-P1-PWR-08	00:18:23:0C:1E:85	7.241.1.54	ipminet1	[UP]
PowerShelf	a05-p1-pwr-01	00:18:23:0C:1E:84	7.241.1.8	ipminet1	[UP]
...					
PowerShelf	a05-p1-pwr-08	00:18:23:0C:1E:8F	7.241.1.80	ipminet1	[UP]
PowerShelf	b06-p1-pwr-01	00:18:23:0C:40:2A	7.241.1.55	ipminet1	[UP]
...					
PowerShelf	b06-p1-pwr-08	00:18:23:0C:40:99	7.241.1.62	ipminet1	[UP]

The `powershelfoverview` command displays an overview of a particular power shelf, showing the measurements from its PSUs (6 in the following example):

Example

```
[basecm11->device*[B05-P1-PWR-01]]% powershelfoverview
```

	Input Supply	Input power	Input current	Input voltage	Rail power	Rail current	Rail voltage	Temperature	Fan speed	Healthy
-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----
1	679 W	2.98 A	240.75 V	652 W	13.06 A	49.85 V	44 C	6.7 KRPM	PASS	

2	632 W	2.8 A	240.75 V	607 W	12.18 A	49.87 V	44 C	6.6 KRPM	PASS
3	599 W	2.64 A	240.75 V	575 W	11.48 A	49.87 V	43 C	6.8 KRPM	PASS
4	599 W	2.63 A	240.75 V	575 W	11.51 A	49.89 V	43 C	6.8 KRPM	PASS
5	617 W	2.76 A	240.5 V	574 W	11.5 A	49.87 V	43 C	6.9 KRPM	PASS
6	609 W	2.64 A	240.5 V	584 W	11.7 A	49.87 V	43 C	6.6 KRPM	PASS

4.2 Power Shelves Networking Configuration

The network interface settings for a specific power shelf can be managed via its IPMI interface. For example, a power shelf, here named B05-P1-PWR-01, can have the following values set with the `set` command:

Example

```
[basecm11->device[B05-P1-PWR-01]->interfaces[eth0]]% show
Parameter                                Value
-----
Revision
Type                                    physical
Network device name                     eth0
Network                                 ipminet1
IP                                       7.241.1.47
DHCP                                    no
Alternative Hostname
Additional Hostnames
Switch ports
Start if                                always
BringUpDuringInstall                    no
On network priority                      60
Bootable                                no
MAC                                      00:18:23:0C:1E:90

4.3 Access Configuration For The Power Management Controller

Access to the Power Management Controller (PMC) is configured in the BMC settings:

Example

```
[basecm11->device[B05-P1-PWR-01]->bmcsettings]% show
Parameter                                Value
-----
Revision
User name                                root
Password                                *****
User ID                                 -1
Power reset delay                       0s
Extra arguments
Privilege                                administrator
```

Authentication allows NVIDIA Mission Control to monitor the power shelves using Redfish sampling.

4.4 Power Shelf Settings Overview

An overview of the settings for a particular power shelf can be viewed with the `show` command:

Example

```
[basecm11->device[B05-P1-PWR-01]]% show
Parameter                               Value
-----
Hostname                               B05-P1-PWR-01
IP                                     7.241.1.47
Network                               ipminet1

4.5 Power Shelf Metrics Overview

A listing of the power shelf metrics can be seen with some grepping (the output for PSUs 2 to 5 have been ellipsized for readability in this manual):

```
[basecm11->monitoring->measurable]% list -f name:40,parameter:9,producer
|head -2; list -f name:40,parameter:9,producer| egrep -i
'(powershell|redfish_power_shelf)'
```

name (key)	parameter	producer

TotalPowerShelfRailPower		AggregatePowerShelf

The descriptions for these metrics are as indicated in table 6.4.

4.6 Power Shelf Firmware

Power shelf firmware is managed by the `firmware` command options as described in Section 14.5.3 of the *Administrator Manual*.

4.7 Power Shelf Circuit Monitoring

A power circuit typically supplies several power shelves, based on the rated power of the circuit and power shelves. Administration and wiring convenience may also play a role in allocating a circuit to a power shelf.

So, for example, the administrator may configure a rack with 6 power shelves so that it is supplied power from one power circuit.

The power circuit breakers used by each power circuit, typically provided by a remote power panel (RPP), can have their locations noted for administrative convenience.

Example

```
[basecm11->powercircuit]% list
Name (key) Row  Room  Building  Location  Racks
-----
RPP-B12-3  1    G    Watchtower  Trantor
RPP-B14-3
RPP-B21-5
RPP-B21-6
RPP-B22-5
...
```

The cluster may have been set up to monitor the power circuit breaker for the power reaching BCM (section 3.4). In that case, the `overview` command typically displays the power consumption and current per phase.

Example

```
[basecm11->powercircuit]% overview RPP-B14-3
Power circuit Power  Current  Current  Current  Current  Racks
-----
RPP-B14-3     15.6 KW 30.137 A  0 A      18.28 A  30.119 A  28.134 A  1
```

A value of 0 A means that the current limit is not reported.

4.8 Power Shelves And Rack Mode Commands

This section discusses some of the commands that can be useful for setting up and viewing devices from within the rack mode of `cmsh` (section 3.15 of the *Administrator Manual*), but with a focus on power shelf management.

4.8.1 The `list` Command

If the attributes of racks in rack mode have been set up in a meaningful way, then the `list` command can give useful information on how the power shelves in racks are organized:

Example

```
[basecm11->rack]% list
Name (key) Room  x-Coord- y-Coord  Height  Devices
-----
A01        T    1        1        48
```

```

A02      T      1      2      48
A03      T      1      3      48
A04      T      1      4      48
A05      T      1      5      48      a05-p1-pwr-01..a05-p1-pwr-08,a05...
A06      T      1      6      48
A07      T      1      7      48
A08      T      1      8      48
A09      T      1      9      48
A10      T      1     10      48
A11      T      1     11      48
A12      T      1     12      48
...

```

The `help set` command describes how these values can be set.

In the preceding example, the administrator has noted that a rack, for example A05, is in a room T, and is at an (x,y) coordinate of (1,5) in that room.

The power shelf devices have also been given meaningful names: a05-p1-pwr-01, a05-p1-pwr-02..., which here has a prefix that is the rack it is in, and uses pwr to indicate it is a power shelf.

4.8.2 The rackoverview Command

The `rackoverview` command displays information about the types of entities in a rack. It also then lists some more detailed information about some of the entity types.

The power shelf one of the types that has more detailed information listed (some output truncated and ellipsized, because this section is focussing on the power shelves):

Example

```

[basecm11->rack]% rackoverview <TAB><TAB>
a01 a02 a03 a04 a05 a06 a07 a08 a09 a10 a11 a12 b01 b02 b03 b04...
[basecm11->rack]% rackoverview a05
Type                Up                Down                Closed                Total
-----
Nodes                18                0                0                18
DPU nodes            0                0                0                0
Managed switches    0                0                0                0
NVLink switches      0                9                0                9
Power shelves        8                0                0                8
Devices              0                0                0                0
Cores                2,592            -                -                2,592
GPUs                 72                -                -                72
...

Power shelf          Input power  Output power  Temperature  Fan speed  Active PSU  Total PSU
-----
a05-p1-pwr-01        0 W         0 W          0 C          0 RPM      0          6
a05-p1-pwr-02        0 W         0 W          0 C          0 RPM      0          6
a05-p1-pwr-03        3.7 KW      3.6 KW       43.3333 C    6.7 KRPM   6          6
a05-p1-pwr-04        2.51 KW     2.38 KW      42.75 C     6.7 KRPM   6          6
a05-p1-pwr-05        2.83 KW     2.69 KW      49 C        6.8 KRPM   6          6
a05-p1-pwr-06        3.7 KW      3.5 KW       45 C        6.7 KRPM   6          6
a05-p1-pwr-07        3.7 KW      3.5 KW       46.3333 C    6.7 KRPM   6          6
a05-p1-pwr-08        3.8 KW      3.7 KW       47.3333 C    6.7 KRPM   6          6
[basecm11->rack]%

```

In the preceding, the A05 rack is seen to have some active power shelves, which show some power-related values.

4.8.3 The display Command

If the cluster administrator has recorded the device positions in the rack, then the `display` command in rack mode is useful for seeing the position of where power shelves are located in the rack:

Example

```
[basecm11->rack]% display |less -R
...
      A05                      B05

48
47

5 NVIDIA Autonomous Hardware Recovery

5.1 Introduction

NVIDIA Mission Control can provide autonomous hardware recovery. This capability can be installed on a cluster managed by BCM.

It is designed to allow a user to carry out:

- automated baseline tests to validate hardware
- automated health checks to detect hardware failures at the track, rack, node, and system levels
- automated break/fix workflows (guided recovery on failure)

Autonomous hardware recovery can be integrated with an NVIDIA Base Command Manager (BCM) that is running a Kubernetes instance. The integration is carried out with the BCM script `nvidia-mission-control-setup` (section 5.3).

The script deploys the autonomous hardware recovery *agents* on all nodes. These agents communicate with the autonomous hardware recovery *backends* that are deployed within Kubernetes worker nodes.

BCM integration allows API access to the agents and provides a GUI to carry out *runbooks*.

More details on autonomous hardware recovery can be found in its dedicated documentation.

The scope of this chapter of the manual is to give guidance on autonomous hardware recovery deployment, and how to access its API and GUI.

5.2 Prerequisites To Install Autonomous Hardware Recovery

Before running the `nvidia-mission-control-setup` script to install autonomous hardware recovery, the following prerequisites must be met:

- A Kubernetes instance that is integrated with BCM (section 4.2 of the *Containerization Manual*) must be running.
- The Kubernetes instance must have the Kubernetes NGINX Ingress controller add-on for route-based access control installed.
- At the time of writing of this section (May 2025), Kyverno must not be installed on the Kubernetes instance, or the installation fails. This is expected to change later on.

As a rough guide to the physical hardware requirements for autonomous hardware recovery, it is expected that a cluster with hundreds of nodes should use a backend node with at least 8 CPUs per node, at least 2 local hard drives, and at least 16 GB RAM per node. More precise physical hardware requirements are best determined with the help of NVIDIA engineers.

5.3 Installation Of NVIDIA Autonomous Hardware Recovery Using nvidia-mission-control-setup

Running `nvidia-mission-control-setup` as the root user starts up the TUI installation (figure 5.1):

Figure 5.1: Selection from `cm-mission-control-setup` of autonomous hardware recovery

Selecting NVIDIA Mission Control autonomous hardware recovery brings up the Helm registry credentials screen (figure 5.2):

Figure 5.2: Setting Helm credentials for autonomous hardware recovery

If the Helm registry password is accepted, then the NVCR registry credentials screen (figure 5.3) comes up:

Figure 5.3: Setting NVCR credentials for autonomous hardware recovery

If the NVCR registry password is accepted, then the API registry credentials screen (figure 5.4) comes up:

Figure 5.4: Setting API credentials for autonomous hardware recovery

If the password for API registry access is accepted, then a TLS certificates screen (figure 5.5) comes up:

Figure 5.5: Setting TLS certificate files for autonomous hardware recovery

After the path to the TLS certificates are entered, a backend node selection screen (figure 5.6) comes up:

Figure 5.6: Setting a backend node for autonomous hardware recovery

After a backend node is selected, a failover node selection screen (figure 5.7) comes up. Selection is optional:

Figure 5.7: Setting an optional failover node for autonomous hardware recovery

After that an agent category selection screen (figure 5.8) comes up:

Figure 5.8: Setting an agent category for autonomous hardware recovery

After that a backend customizations screen (figure 5.9) comes up:

Figure 5.9: Setting backend customizations for autonomous hardware recovery

The endpoints set in the backend should resolve either to the active head node, or to the backend pod node.

A warnings screen appears if the domains cannot be resolved (figure 5.10):

Figure 5.10: Configuration warnings for autonomous hardware recovery

After that a storage customizations screen for the backend appears (figure 5.11) with suggested default values:

Figure 5.11: Storage customizations for the backend for autonomous hardware recovery

The TUI then asks if monitoring should be set up.

If monitoring is to be configured, then values for the Prometheus and Grafana Tempo endpoints, and for the Prometheus and Grafana Tempo API keys must be entered. The HTTP user ID and password for Loki logging must also be entered (figure 5.12):

Figure 5.12: Monitoring values configuration for autonomous hardware recovery

The agent version should be set (figure 5.13):

Figure 5.13: Agent version setting for autonomous hardware recovery

The configuration from the wizard can be saved and the configuration can be deployed (figure 5.14):

Figure 5.14: Saving the configuration and deploying it for autonomous hardware recovery

The API (described in <https://ssapi.shorelinesoftware.net/>) can be tested to verify that is working.

6 NVIDIA Mission Control DGX GB200 Measurables

Measurables are metrics, health checks, and enummetrics (appendix G of the *Administrator Manual*).

This section describes the extra DGX GB200 measurables and their parameters that may not have been described in appendix G of the *Administrator Manual*. The DGX GB200 measurables are grouped in this chapter according to the following themes:

- circuit-related metrics (section 6.1)
- leak detection measurables (section 6.2)
- NVLink measurables (section 6.3)
- power shelf measurables (section 6.4)
- cooling distribution unit metrics (section 6.5)
- GPU measurables (section 6.6)
- Prometheus metrics (section 6.7)
- Redfish metrics (section 6.8)
- Redfish enums (section 6.9)

6.1 Circuit-Related DGX GB200 Metrics

Electrical power in the data center is supplied to the DGX GB200 racks from a circuit that is typically from a remote power panel (RPP) or an overhead busway.

Circuit-related metrics for the DGX GB200 platform are shown in table 6.1.

Table 6.1: Circuit-related DGX GB200 metrics

DGX GB200 Circuit Metric	Parameter	Description
CircuitCurrent		
CircuitPhaseCurrent	phase=1	
CircuitPhaseCurrent	phase=2	
CircuitPhaseCurrent	phase=3	
CircuitPower		
RackCircuitCurrent*	circuit=RPP-B12-3	
RackCircuitCurrentLimit*	circuit=RPP-B12-3	
RackCircuitPhaseCurrent**,**	circuit=RPP-B12-3;phase=3	
RackCircuitPower*	circuit=RPP-B12-3	
TotalCircuitCurrent		Total
TotalCircuitCurrentLimit		Total
TotalCircuitPhaseCurrent		Total
TotalCircuitPhaseCurrent	phase=1	Total
TotalCircuitPhaseCurrent	phase=2	Total
TotalCircuitPhaseCurrent	phase=3	Total
TotalCircuitPower		Total

* The parameter set here depends on the listed power circuit name (section 4.7)

** The phase value can be 1, 2, or 3

6.2 Leak Detection DGX GB200 Measurables

Liquid cooling is used in the DGX GB200. The ability to detect leaking coolant is an important enough concern that there are several measurables associated with it.

Leak detection measurables for the DGX GB200 platform are shown in table 6.2:

Table 6.2: Leak detection DGX GB200 measurables

DGX GB200 leak measurable	Parameter	Description
LeakResponseRackElectrical\IsolationStatus		
LeakResponseRackLiquidIso\IsolationStatus		
LeakSensorFaultRack		
DevicesWithLeaks	Total	Number of devices that have detected a leak
RF_Chassis_0_LeakDetector_0_ColdPlate*		
RF_Chassis_0_LeakDetector_0_Manifold*		
RF_Chassis_0_LeakDetector_0_	state	Enum, not metric

...continues

Table 6.2: Leak detection DGX GB200 measurables...continued

DGX GB200 leak measurable	Parameter	Description
ColdPlate*		
RF_Chassis_0_LeakDetector_0_Manifold*	state	Enum, not metric
RF_LD_LeakDetection		Enum
RF_LeakDetector	Chassis_0_LeakDetector_0_ColdPlate*	Enum
RF_LeakDetector	Chassis_0_LeakDetector_0_Manifold*	Enum

* The substring LeakDetector_0 can also take the value LeakDetector_1

6.3 DGX GB200 NVLink Measurables

NVLink-related measurables for the DGX GB200 platform are shown in table 6.3.

The measurables without the RF_ prefix are provided by the ClusterTotal data producer. The measurables with the RF_ prefix are provided via Redfish.

BCM picks up the Redfish measurables and their descriptions automatically. Many measurables still have no associated descriptions. For now, the names of the measurables can be a guide on what they are about.

Table 6.3: DGX GB200 NVLink measurables

DGX GB200 NVLink measurables	Parameter	Description
NVLinkSwitchesClosed		Number of NVLink switches not marked as UP or DOWN
NVLinkSwitchesDown		Number of NVLink switches marked as DOWN
NVLinkSwitchesTotal		Total number of NVLink switches
NVLinkSwitchesUp		Number of NVLink switches marked as UP
RF_NVLink_Port_Nvidia_BitErrorRate*		
RF_NVLink_Port_Nvidia_LinkDowned*		
RF_NVLink_Port_Nvidia_RXNoProtocol*		
RF_NVLink_Port_Nvidia_TXNoProtocol*		
RF_NVLink_Port_Nvidia_TXWait*		
RF_NVLink_Port_RX*		
RF_NVLink_Port_RXFrames_Networking*		
RF_NVLink_Port_RX_Total		
RF_NVLink_Port_TX*		
RF_NVLink_Port_TXFrames_Networking*		

...continues

Table 6.3: DGX GB200 NVLink measurables...continued

DGX GB200 NVLink measurables	Parameter	Description
RF_NVLink_Port_TX_Total		
RF_NVLink_ResourceHealthRollup_Status		
RF_NVLink_ResourceHealth_Status		
RF_NVLink_ResourceState_Status*		
RF_NVLink_Resource_CurrentSpeed*		
RF_NVLink_Resource_LinkState*		
RF_NVLink_Resource_LinkStatus*		
RF_NVLink_Resource_MaxSpeed*		
RF_NVLink_Resource_Nvidia_RXWidth*		
RF_NVLink_Resource_Nvidia_TXWidth*		

* The parameter here is one of 17 ports from the node to the switch.
It can take a value of acp0 to acp17

6.4 DGX GB200 Power Shelf Measurables

The list of power shelf measurables on a DGX GB200 platform are displayed in table 6.4.

These are produced by the redfish_power_shelf, ClusterTotal, and AggregatePowerShelf data producers.

Table 6.4: Power shelf measurables

Power Shelf Measurable	Parameter	Description
AveragePowerShelfTemperature*		Average power shelf temperature
PowerShelvesClosed**		Number of power shelves not marked as UP or DOWN
PowerShelvesDown**		Number of power shelves marked as DOWN
PowerShelvesTotal**		Total number of power shelves
PowerShelvesUp**		Number of power shelves marked as UP
RF_Active_PSU		Number of PSUs of power shelf active
RF_Health_PSU†		Are all PSUs of power shelf active?
RF_PowerShelf_Status†	1	Status of power shelf PSU 1
RF_PowerShelf_Status	total	Status of power shelf PSU, total
RF_Power_Supply_Energy†	1	Energy consumption of PSU 1 since boot
RF_Power_Supply_Energy	total	Energy consumption of all PSUs of power shelf since boot, total
RF_Power_Supply_FanSpeed†	1	Fan speed of PSU 1
RF_Power_Supply_FanSpeed	average	Fan speed of all PSUs of power shelf, averaged
RF_Power_Supply_Id†	1	
RF_Power_Supply_InputCurrent†	1	Input current for PSU 1
RF_Power_Supply_InputCurrent	total	Input current for all PSUs of power shelf, total

...continues

Table 6.4: Power shelf measurables...continued

Power Shelf Measurable	Parameter	Description
RF_Power_Supply_InputPower [†]	1	Input power for PSU 1
RF_Power_Supply_InputPower	total	Input power for all PSUs of power shelf, total
RF_Power_Supply_InputVoltage [†]	1	Input voltage for PSU 1
RF_Power_Supply_LifetimeReading_Energy [†]	1	Input lifetime reading for energy for PSU 1
RF_Power_Supply_Name [†]	1	
RF_Power_Supply_OutputPower [†]	1	Output power for PSU 1
RF_Power_Supply_OutputPower	total	Output power for all PSUs of power shelf, total
RF_Power_Supply_PowerFactor_Input [†]	1	
RF_Power_Supply_RailCurrent [†]	1	Rail Current for PSU 1
RF_Power_Supply_RailCurrent	total	Rail Current for all PSUs of power shelf, total
RF_Power_Supply_RailPower [†]	1	Rail power for PSU 1
RF_Power_Supply_RailPower	total	Rail power for all PSUs of power shelf, total
RF_Power_Supply_RailVoltage [†]	1	Rail voltage for PSUs 1
RF_Power_Supply_Temperature [†]	1	Temperature for PSU 1
RF_Power_Supply_Temperature	average	Temperature for all PSUs of power shelf, averaged
RF_Power_Supply_code_error [†]	1	Code error for PSU 1
RF_Power_Supply_message_error [†]	1	Message error for PSU 1
RF_Summary_Metrics_Id		
RF_Summary_Metrics_Name		
RF_Summary_Metrics_Power		Power consumption (Watts)
RF_Summary_Metrics_Temperature		Temperature (Celsius)
RF_Total_PSU		
TotalPowerShelfActivePSU*		Total power shelf PSUs active
TotalPowerShelfAvailablePSU*		Total power shelf PSUs available
TotalPowerShelfCriticalPSU [‡]		Are all active PSUs below critical threshold?
TotalPowerShelfDegradedPSU [‡]		Are all active PSUs below degraded threshold?
TotalPowerShelfHealthyPSU [‡]		Are all PSUs active?
TotalPowerShelfInputCurrent*		Total power shelf input current
TotalPowerShelfInputPower*		Total power shelf input power
TotalPowerShelfRailCurrent*		Total power shelf rail current
TotalPowerShelfRailPower*		Total power shelf rail power
TotalPowerShelfPSU*		Total power shelf PSU

* From AggregatePowerShelf data producer

** From ClusterTotal data producer

[†] Takes the PSU number as a parameter. On the DGX GB200 it can be from 1 to 6[‡] Health check

6.5 Cooling Distribution Unit Metrics On The DGX GB200

Metrics for the cooling distribution units (CDUs) of the DGX GB200 platform are shown in table 6.5. The data producers for these are:

- MonitoringSystem for the metrics in the table beginning with the string CDU
- AggregateCDU for the metrics in the table that begin with the strings Average or Total

Table 6.5: DGX GB200 metrics for CDUs

DGX GB200 CDU Metric	Description
AverageCDULiquidDifferentialPressure	Average CDU liquid cooling differential pressure (Pa)
AverageCDULiquidFlow	Average CDU liquid cooling flow (LPM)
AverageCDULiquidReturnTemperature	Average CDU liquid cooling return temperature (°C)
AverageCDULiquidSupplyTemperature	Average CDU liquid cooling supply temperature (°C)
AverageCDULiquidSystemPressure	Average CDU liquid system pressure (Pa)
CDUAvailable	CDU available
CDULiquidDifferentialPressure	CDU liquid differential pressure (Pa)
CDULiquidFlow	CDU liquid flow (LPM)
CDULiquidReturnTemperature	CDU liquid return temperature (°C)
CDULiquidSupplyTemperature	CDU liquid supply temperature (°C)
CDULiquidSystemPressure	CDU liquid system pressure (Pa)
CDUStatus	CDU status (l/s)
TotalCDUAvailable	Total CDU available
TotalCDUStatus	Total CDU status

6.6 GPU Measurables For The DGX GB200

Some basic GPU measurables are covered in appendix G of the *Administrator Manual*.

Extra GPU measurables available on the DGX GB200 platform are:

Table 6.6:

GPU Measurables For The DGX GB200	Parameter	Description
gpu_board_limit_violation*	gpu0	Board violation limit
gpu_board_limit_violation	total	Throttling duration due to board limits
gpu_c2c_link_bandwidth*	gpu0	GPU C2C link bandwidth
gpu_c2c_link_count*	gpu0	GPU C2C link count
gpu_c2c_link_status*	gpu0	GPU C2C link status
gpu_correctable_remapped_rows*	gpu0	Number of remapped rows for correctable errors
gpu_dec_utilization	average	Average GPU decoder utilization
gpu_dec_utilization	gpu0	GPU decoding usage
gpu_ecc_dbe_agg*	gpu0	Total double bit aggregate ECC errors
gpu_ecc_dbe_vol*	gpu0	Total double bit volatile ECC errors
gpu_ecc_sbe_agg*	gpu0	Total single bit aggregate ECC errors

...continues

Table 6.6: ...continued

GPU Measurables For The DGX GB200	Parameter	Description
gpu_ecc_sbe_vol*	gpu0	Total single bit volatile ECC errors
gpu_enc_utilization	average	Average GPU encoder utilization
gpu_enc_utilization*	gpu0	GPU encoding usage
gpu_enforced_power_limit*	gpu0	GPU enforced power limit
gpu_enforced_power_profile_mask*	gpu0	Enforced workload power profile mask
gpu_fabric_status*	gpu0	Status of the nvlink link domain (Enum)
gpu_fan_speed*	gpu0	GPU fan speed percentage
gpu_hbm_memory_temperature*	gpu0	High bandwidth memory (GPU memory) temperature
gpu_health_driver*,**	gpu0	Driver-related status
gpu_health_hostengine**,		Host engine status
gpu_health_inforom*,**	gpu0	Inforom status
gpu_health_mcu*,**	gpu0	Microcontroller unit status
gpu_health_mem*,**	gpu0	Memory status
gpu_health_nvlink*,**	gpu0	NVLINK system status
gpu_health_nvswitch_fatal*,**	gpu0	NV switch fatal errors
gpu_health_nvswitch_non_fatal*,**	gpu0	NV switch non fatal errors
gpu_health_overall**		Overall system status
gpu_health_overall*,**	gpu0	Overall system status for the specified GPU
gpu_health_pcie*,**	gpu0	PCIe system status
gpu_health_pmu*,**	gpu0	Power management unit status
gpu_health_power*,**	gpu0	Power status
gpu_health_sm*,**	gpu0	Streaming multiprocessor status
gpu_health_thermal*,**	gpu0	Temperature status
gpu_low_util_violation*	gpu0	Low utilization violation limit
gpu_low_util_violation	total	Throttling duration due to low utilization limits
gpu_mem_clock*	gpu0	GPU memory clock
gpu_mem_copy_utilization	average	Average GPU memory copu utilization
gpu_mem_copy_utilization*	gpu0	Percentage of the GPU memory copy used
gpu_mem_free*	gpu0	Amount of GPU free memory
gpu_mem_total*	gpu0	GPU framebuffer size
gpu_mem_total	total	combined GPU total memory
gpu_mem_used*	gpu0	Amount of GPU used memory
gpu_mem_used	total	combined GPU memory usage
gpu_mem_utilization	average	Average GPU memory utilization
gpu_mem_utilization*	gpu0	Percentage of GPU memory used
gpu_memory_temp	average	Average GPU memory temperature
gpu_memory_temp*	gpu0	GPU memory temperature
gpu_nvlink_crc_data_errors*	gpu0	Total nvlink data CRC errors over all lanes
gpu_nvlink_crc_flit_errors*	gpu0	Total nvlink flit CRC errors over all lanes
gpu_nvlink_total_bandwidth*	gpu0	Total nvlink bandwidth used
gpu_nvlink_total_bandwidth	total	combined GPU nvlink bandwidth

...continues

Table 6.6: ...continued

GPU Measurables For The DGX GB200	Parameter	Description
gpu_performance_state*	gpu0	GPU performance state (0=highest)
gpu_power_management_limit*	gpu0	GPU power management limit
gpu_power_usage*	gpu0	GPU power usage
gpu_power_usage	total	combined GPU power usage
gpu_power_violation*	gpu0	Throttling duration due to power constraints
gpu_power_violation	total	Throttling duration due to power constraints
gpu_reliability_violation*	gpu0	Reliability violation limit
gpu_reliability_violation	total	Throttling duration due to reliability limits
gpu_requested_power_profile_mask*	gpu0	Requested workload power profile mask
gpu_row_remap_failure*	gpu0	Remapping of rows failures
gpu_shutdown_temp*	gpu0	GPU shutdown temperature
gpu_slowdown_temp*	gpu0	GPU slowdown temperature
gpu_sm_clock*	gpu0	GPU shader multiprocessor clock
gpu_sync_boost_violation*	gpu0	Throttling duration due to sync boost constraints
gpu_sync_boost_violation	total	Throttling duration due to sync boost constraints
gpu_temperature	average	Average GPU temperature
gpu_temperature*	gpu0	GPU temperature
gpu_thermal_violation*	gpu0	Throttling duration due to thermal constraints
gpu_thermal_violation	total	Throttling duration due to thermal constraints
gpu_total_app_clocks_violation*	gpu0	App clock violation limit
gpu_total_app_clocks_violation	total	Throttling duration due to application clocks limits
gpu_total_base_clocks_violation*	gpu0	Base clock violation limit
gpu_total_base_clocks_violation	total	Throttling duration due to base clocks limits
gpu_uncorrectable_remapped_rows*	gpu0	Number of remapped rows for uncorrectable errors
gpu_utilization	average	Average GPU utilization
gpu_utilization*	gpu0	GPU utilization percentage
gpu_xid_error*	gpu0	The value is the specific XID error

* parameter can be gpu0, gpu1...

** health check

6.7 Prometheus Metrics For The DGX GB200

Extra Prometheus metrics available on the DGX GB200 platform are shown in table 6.7.

The data producer for the metrics with a prefix of `job_metadata_` is `JobMetadataSampler`. The remaining metrics are produced by `JobSampler`.

BCM picks up the measurables and their descriptions automatically. Many measurables still have no associated descriptions. For now, the names of the measurables can be a guide on what they are about.

Table 6.7:

Prometheus Metrics For The DGX GB200	Description
job_cpu_power_limit	CPU power limit
job_cpu_power_usage	
job_cpu_temperature	Total CPU time consumed by processes
job_cpuacct_usage_seconds	
job_gpu_board_limit_violation	
job_gpu_c2c_link_count	
job_gpu_c2c_link_status	
job_gpu_correctable_remapped_rows

job_metadata_waiting_seconds	

6.8 Redfish Metrics For The DGX GB200

Redfish monitoring can be carried out for devices with a Redfish subscription. The `redfishsubscriptions` command can be used to check if a device has a subscription.

Example

```
[basecm11->device]% redfishsubscriptions node001
hostname      ...initialized ip      kind      port      ssl      subscribed...
-----
node001       ...true      7.241.2.13 GB200     443      true      true
```

Redfish firmware metrics that may be available on the DGX GB200 platform are shown in table 6.8.

As is usual with hardware, the metrics can change according to hardware and especially with firmware changes. The table should therefore be regarded as an indication of what metrics are available, and not a list of what metrics must exist.

BCM picks up the metrics and their descriptions automatically. Many metrics have no associated descriptions. For now, the names of the metrics can be a guide on what they are about.

The list of Redfish metrics available can be found by running:

Example

```
basecm11->monitoring->measurable]% list metric | grep RF_
```

Table 6.8:

Redfish Metrics For The DGX GB200	Description
RF_AOC_NIC1Temp ^[1]	AOC NIC 1 Temperature

^[1] The substring NIC1Temp can also be NIC2Temp, NIC3Temp...

^[2] from redfish_power_shelf data producer

^[3] The substring CPU_0 can also be CPU_1

^[4] The substring FAN_1 can also be FAN_2, FAN_3...

^[5] From redfish_leak data producer

^[6] The substring GPU_0 can also be GPU_1, GPU_2...

^[7] On the DGX GB200 the value of <number> in ...NVLink_<number>... can be from 0 to 71

^[8] Takes the PSU number as a parameter. On the DGX GB200 it can be from 1 to 6

^[9] Takes total as a parameter. On the DGX GB200 it means the total value of the 6 PSUs

^[10] Takes average as a parameter. On the DGX GB200 it means the average value of the 6 PSUs

^[11] On the DGX GB200 the value of <number> in ...ProcessorModule_<number>... can be 0 or 1

^[12] The substring ProcessorModule_0 can also be ProcessorModule_1

6.9 Redfish Enums For The DGX GB200

Redfish monitoring can be carried out for devices with a Redfish subscription (page 46).

Redfish firmware enums that may be available on the DGX GB200 platform are shown in table 6.9.

As is usual with hardware, the metrics can change according to hardware and especially with firmware

changes. The table should therefore be regarded as an indication of what metrics are available, and not a list of what metrics must exist.

The list of Redfish enums that are there on the DGX GB200 platform can be found by running:

Example

```
basecm11->monitoring->measurable]% list enum | grep RF_
```

Table 6.9:

Redfish Enums For The DGX GB200	Parameter	Description

Redfish Enums For The DGX GB200	Parameter	Description
^[1] The number used in the substring Chassis_0 and the substring FAN_ can vary ^[2] The substring GPU_0 can be GPU_1, GPU_2... ^[3] Produced by redfish_leak data producer ^[4] The parameter substring acp0 can be acp1, acp2... ^[5] The substring NVSwitch_0 can be NVSwitch_1, NVSwitch_2... ^[6] The substring ProcessorModule_0 can be ProcessorModule_1, ProcessorModule_2... ^[7] The substring SSD_0 can be SSD_1, SSD_2..., and the substring StorageBackplane_0 can be StorageBackplane_1, StorageBackplane_2...		

6.10 Health Checks For The DGX GB200

Redfish health checks that may be additionally available on the DGX GB200 platform are shown in table 6.10.

As is usual with hardware, the health checks can change according to hardware and especially with firmware changes. The table should therefore be regarded as an indication of the health checks that are available, and not a list of the health checks that must exist.

The list of Redfish health checks that are there can be found by running:

Example

```
[basecm11->monitoring->measurable]% list healthcheck
```

Table 6.10: DGX GB200 Health Checks

DGX GB200 Health Check	Parameter	Description
gpu_health_driver	gpu0	Driver-related status
gpu_health_hostengine		Host engine status
gpu_health_inforom	gpu0	Inforom status
gpu_health_mcu	gpu0	Microcontroller unit status
gpu_health_mem	gpu0	Memory status
gpu_health_nvlink	gpu0	NVLINK system status
gpu_health_nvswitch_fatal	gpu0	NV switch fatal errors
gpu_health_nvswitch_non_fatal	gpu0	NV switch non-fatal errors
gpu_health_overall		Overall system status
gpu_health_overall	gpu0	Overall system status for GPU0
gpu_health_pcie	gpu0	PCIe system status
gpu_health_pmu	gpu0	Power management unit status
gpu_health_power	gpu0	Power status
gpu_health_sm	gpu0	Streaming multiprocessor status
gpu_health_thermal	gpu0	Temperature status
nvsm_pci_health		Checks health of PCI devices in a DGX system
