Rights and Restrictions
All statements, specifications, recommendations, and technical information contained herein are current or planned as of the date of publication of this document. They are reliable as of the time of this writing and are presented without warranty of any kind, expressed or implied. Bright Computing, Inc. shall not be liable for technical or editorial errors or omissions which may occur in this document. Bright Computing, Inc. shall not be liable for any damages resulting from the use of this document.

Limitation of Liability and Damages Pertaining to Bright Computing, Inc.
The Bright Cluster Manager product principally consists of free software that is licensed by the Linux authors free of charge. Bright Computing, Inc. shall have no liability nor will Bright Computing, Inc. provide any warranty for the Bright Cluster Manager to the extent that is permitted by law. Unless confirmed in writing, the Linux authors and/or third parties provide the program as is without any warranty, either expressed or implied, including, but not limited to, marketability or suitability for a specific purpose. The user of the Bright Cluster Manager product shall accept the full risk for the quality or performance of the product. Should the product malfunction, the costs for repair, service, or correction will be borne by the user of the Bright Cluster Manager product. No copyright owner or third party who has modified or distributed the program as permitted in this license shall be held liable for damages, including general or specific damages, damages caused by side effects or consequential damages, resulting from the use of the program or the un-usability of the program (including, but not limited to, loss of data, incorrect processing of data, losses that must be borne by you or others, or the inability of the program to work together with any other program), even if a copyright owner or third party had been advised about the possibility of such damages unless such copyright owner or third party has signed a writing to the contrary.

0.1 About This Manual
This manual is aimed at helping cluster administrators install, understand, configure, and manage basic machine learning capabilities easily using Bright Cluster Manager. The administrator is expected to be reasonably familiar with the Administrator Manual.

0.2 About The Manuals In General
Regularly updated versions of the Bright Cluster Manager 8.1 manuals are available on updated clusters by default at/cm/shared/docs/cm. The latest updates are always online at http://support.brightcomputing.com/manuals.

- The Installation Manual describes installation procedures for a basic cluster.
- The Administrator Manual describes the general management of the cluster.
- The User Manual describes the user environment and how to submit jobs for the end user.
- The Cloudbursting Manual describes how to deploy the cloud capabilities of the cluster.
- The Developer Manual has useful information for developers who would like to program with Bright Cluster Manager.
- The OpenStack Deployment Manual describes how to deploy OpenStack with Bright Cluster Manager.
- The Big Data Deployment Manual describes how to deploy Big Data with Bright Cluster Manager.

If the manuals are downloaded and kept in one local directory, then in most pdf viewers, clicking on a cross-reference in one manual that refers to a section in another manual opens and displays that section in the second manual. Navigating back and forth between documents is usually possible with keystrokes or mouse clicks.

For example: <Alt>-<Backarrow> in Acrobat Reader, or clicking on the bottom leftmost navigation button of xpdf, both navigate back to the previous document.

The manuals constantly evolve to keep up with the development of the Bright Cluster Manager environment and the addition of new hardware and/or applications. The manuals also regularly incorporate customer feedback. Administrator and user input is greatly valued at Bright Computing. So any comments, suggestions or corrections will be very gratefully accepted at manuals@brightcomputing.com.

There is also a feedback form available via Bright View, via the Account icon, following the clickpath:
Account→Help→Feedback
0.3 Getting Administrator-Level Support

If the reseller from whom Bright Cluster Manager was bought offers direct support, then the reseller should be contacted. Otherwise the primary means of support is via the website https://support.brightcomputing.com. This allows the administrator to submit a support request via a web form, and opens up a trouble ticket. It is a good idea to try to use a clear subject header, since that is used as part of a reference tag as the ticket progresses. Also helpful is a good description of the issue. The followup communication for this ticket goes via standard e-mail. Section 13.2 of the Administrator Manual has more details on working with support.

0.4 Getting Professional Services

Bright Computing normally differentiates between professional services (customer asks Bright Computing to do something or asks Bright Computing to provide some service) and support (customer has a question or problem that requires an answer or resolution). Professional services can be provided after consulting with the reseller, or the Bright account manager.
Introduction And Machine Learning Packages Installation

1.1 Introduction

From Bright Cluster Manager version 7.3 onward, a number of machine learning and deep learning library and framework packages can be used. The packages provided make it faster and easier for organizations to install the latest state-of-the-art libraries, and gain insights from rich, complex data.

1.1.1 Bright Cluster Manager Versions—Associated Repositories And Support For Machine Learning Packages

- In Bright Cluster Manager versions 7.3 and 8.0 the machine learning and deep learning packages are experimentally accessible to a cluster from the standard Bright cm repository. However, from Bright Cluster Manager version 8.1 onward, these packages are distributed via a separate Bright cm-ml repository.

- In Bright Cluster Manager versions 8.1 and 8.2, cluster administrators have to activate the Data Science Add-on using the online wizard at:

  The add-on enables the dedicated Bright cm-ml repository.

- From Bright Cluster Manager version 9.0 onward the activation step via a wizard is not needed—the repository is automatically available and enabled.

  Only if the cluster is licensed for the Data Science Add-on package does Bright provide support for the integration of packages distributed in the dedicated repository with Bright Cluster Manager.

  For convenience, a summary of the Bright for Data Science (B4DS) repository configuration requirements is shown in table 1.1:
## 1.1 Introduction And Machine Learning Packages Installation

### Table 1.1: Bright Cluster Manager offering overview for Machine Learning packages

<table>
<thead>
<tr>
<th>Bright CM</th>
<th>Packages repository</th>
<th>Repository configuration</th>
<th>Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.3</td>
<td>Traditional (cm)</td>
<td>Automatically available and enabled</td>
<td>Not available</td>
</tr>
<tr>
<td>8.0</td>
<td>Traditional (cm)</td>
<td>Automatically available and enabled</td>
<td>Not available</td>
</tr>
<tr>
<td>8.1</td>
<td>Dedicated (cm-ml)</td>
<td>Requires B4DS Add-on activation*</td>
<td>Requires B4DS Add-on</td>
</tr>
<tr>
<td>8.2</td>
<td>Dedicated (cm-ml)</td>
<td>Requires B4DS Add-on activation*</td>
<td>Requires B4DS Add-on</td>
</tr>
<tr>
<td>9.0</td>
<td>Dedicated (cm-ml)</td>
<td>Automatically available and enabled</td>
<td>Requires B4DS Add-on</td>
</tr>
<tr>
<td>9.1</td>
<td>Dedicated (cm-ml)</td>
<td>Automatically available and enabled</td>
<td>Requires B4DS Add-on</td>
</tr>
<tr>
<td>9.2</td>
<td>Dedicated (cm-ml)</td>
<td>Automatically available and enabled</td>
<td>Requires B4DS Add-on</td>
</tr>
</tbody>
</table>

An administrator who is upgrading a cluster that has machine learning and deep learning packages installed on it should always make sure that the dedicated Bright cm-ml repository is accessible, if required by the new Bright Cluster Manager version.

### 1.1.2 Bright Cluster Manager Versions—Supported Distributions And Architecture For Machine Learning Packages

At the time of writing, December 2021, a number of different Linux distribution versions and architectures are supported, depending on the Bright Cluster Manager version. For convenience, a support matrix for this is shown in table 1.2:

### Table 1.2: Supported Linux distributions and architectures for Bright Machine Learning packages

<table>
<thead>
<tr>
<th>Bright CM</th>
<th>Architectures</th>
<th>Linux distributions</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.3</td>
<td>x86_64</td>
<td>CentOS 7, RHEL 7, SLES 12</td>
</tr>
<tr>
<td>8.0</td>
<td>x86_64</td>
<td>CentOS 7, RHEL 7, SLES 12</td>
</tr>
<tr>
<td>8.1</td>
<td>x86_64</td>
<td>CentOS 7, RHEL 7, SLES 12</td>
</tr>
<tr>

<td>x86_64</td>
<td>CentOS 7, RHEL 7, SLES 12, Ubuntu 18.04</td>
</tr>
<tr>
<td>9.0</td>
<td>x86_64</td>
<td>CentOS 7, CentOS 8, RHEL 7, RHEL 8, SLES 12, SLES 15, Ubuntu 18.04</td>
</tr>
<tr>
<td>9.1</td>
<td>x86_64</td>
<td>CentOS 7, CentOS 8, RHEL 7, RHEL 8, Rocky 8, SLES 12, SLES 15, Ubuntu 18.04, Ubuntu 20.04</td>
</tr>
</tbody>
</table>

An updated list of the supported Linux distributions and architectures available for the various Bright Cluster Manager versions can be found at [https://support.brightcomputing.com/feature-matrix/](https://support.brightcomputing.com/feature-matrix/), in the section of the Feature column dedicated to machine learning.

### 1.2 Available Packages

An updated list of the machine learning packages available for the various Bright Cluster Manager versions can be found at [https://support.brightcomputing.com/packages-dashboard/](https://support.brightcomputing.com/packages-dashboard/). Most of the machine learning packages are to be found within the ml group. However, some of them are found within the cm group for legacy reasons.

At the time of writing, December 2021, the following packages were available:
### Table 1.3: Machine Learning packages provided by the Bright Cluster Manager repositories

<table>
<thead>
<tr>
<th>Package name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bazel (D)</td>
<td>An open-source build and test tool similar to Make, Maven, and Gradle. It uses a human-readable, high-level build language. Bazel supports projects in multiple languages and builds outputs for multiple platforms.</td>
</tr>
<tr>
<td>caffe (D)</td>
<td>A deep learning framework made with expression, speed, and modularity in mind, developed by Berkeley AI Research and by community contributors.</td>
</tr>
<tr>
<td>caffe-mpi (D)</td>
<td>A parallel version for multi-node GPU cluster, which is designed based on the NVIDIA/Caffe forked from the Berkeley AI Research/caffe.</td>
</tr>
<tr>
<td>caffe2 (D)</td>
<td>A lightweight, modular, and scalable deep learning framework. Building on the original Caffe, Caffe2 is designed with expression, speed, and modularity in mind. It is now merged into PyTorch.</td>
</tr>
<tr>
<td>chainer (D)</td>
<td>A flexible framework for neural networks, designed to write complex architectures simply and intuitively.</td>
</tr>
<tr>
<td>chainer-python3 (D)</td>
<td>Python 3 package for Chainer.</td>

Legend:

- D: Deprecated
- C: CentOS 7
- R: RHEL 7

Package are available for every distribution unless otherwise tagged.

Examples:

- cm-bazel is available for every distribution.
- cm-chainer-py37-cuda10.1-gcc (R7) is only available for RHEL7.

1.2.1 Considerations

There are some considerations that the cluster administrator should be aware of with the packages.

- Some packages may be labelled in the table 1.3 as deprecated. “Deprecated” in the software industry is not a well-defined term. Here it is used by Bright Computing to mean a package that may no longer be offered in a future release, or for which a newer existing version is preferred.

- Several different packages may be provided for the same machine learning library or framework. For example, TensorFlow may be provided by:

  - cm-tensorflow-py36-cuda10.1-gcc or
  - cm-tensorflow2-py39-cuda11.2-gcc9

As is the norm with other package management systems in the software industry, the name given to a Bright Computing package includes the most relevant dependencies required to build and use
it. The dependencies commonly highlighted in this manner are:

- Python interpreter version used (e.g. *-py36*, *-py37* and *-py39*)
- accelerator library used (e.g. *-cuda10.1*, *-cuda10.2*, *-cuda11.2* and *-mkl*)
- compiler used (e.g. *-gcc*, *-gcc8* and *-gcc9*)

The availability of different variants of the same package makes it easier for administrators to set up a working environment that is suited to their needs.

• Machine learning packages are designed to coexist, and can therefore all be installed at the same time. This also applies to different variants of the same library or framework. This means that administrators can install different versions of the same machine learning library or framework, simply by using different variants. For example: an older *-py36* version of TensorFlow, as well as a more recent *-py37* version of TensorFlow, can both be installed at the same time.

• As is done with other packages provided by Bright Computing, the updates released for machine learning libraries and frameworks generally leave their major versions unchanged. Whenever a major version for a third party machine learning library or a framework is publicly released, a new package or a set of packages is typically placed in the repository. Such package(s) imply or contain a reference to the major version in the name. For example:

  - cm-tensorflow-* is the name used for TensorFlow major version 1
  - cm-tensorflow2-* is the name for TensorFlow major version 2

As a result, administrators can safely upgrade cluster packages without breaking backward compatibility with users’ applications.

• MPI modules and libraries should not be blindly added by the cluster administrator. During module loading, warnings are typically given to suggest an MPI library (Open MPI, or an MPICH or MVAPICH implementation of Open MPI) is required. However, the exact implementation of the MPI library that can be used depends upon the hardware (GPU, interface, architecture) used and requires judgment of suitability by the cluster administrator. Bright Cluster Manager uses the cm-openmpi4-cuda10.2-ofed50-gcc8 package in this manual as the reference MPI library implementation. This driver package corresponds with using Open MPI with Gigabit Ethernet networking, InfiniBand networking, and NVIDIA GPUs.

1.3 Requirements

The following requirements must be met before installing the preceding machine learning packages.

• RHEL users must have access to the YUM repositories and EPEL repository.

• There must be enough free space for the packages that are installed on the head node and compute nodes. The actual amount depends on the packages installed.

• 8 GB of RAM on the nodes is the minimum recommended amount.

• In order to use packages built with the CUDA toolkit accelerator library version 10.2 and below (e.g. *-cuda10.2*), the NVIDIA GPUs must be Maxwell or more recent, with compute capability 3.5 or later. CUDA compute capability 6.0 or later is recommended.

• In order to use packages built with the CUDA toolkit accelerator library version 11.0 and above (e.g. *-cuda11.2*), the NVIDIA GPUs must be Maxwell or more recent, with compute capability 5.2 or later. CUDA compute capability 6.0 or later is recommended.
• In order to use packages built using CUDA as the accelerator (i.e. *-cuda*), the CPU must support the AVX/AVX2, FMA, and SSE4.2 instructions. This can be checked by inspecting the CPU flags:

Example

```
[root@node ~]# egrep -m1 -o '(avx|avx2|fma|sse4_2)' /proc/cpuinfo
fma
sse4_2
avx
avx2
```

• In order to use packages built using MKL as the accelerator (i.e. *-mkl*), the CPU must support the AVX-512 Vector Neural Network Instructions (VNNI). Examples of such CPUs are Intel Xeon Scalable processors with Deep Learning Boost.

## 1.4 Machine Learning Packages Installation

### Head Node Installation

Bright Cluster Manager machine learning packages are installed in the `/cm/shared` directory, which is by default exported over NFS. Packages installed on the head node are therefore also available to all the compute nodes by default.

The `.rpm` and `.deb` files have proper dependencies defined. This means that the cluster administrator does not need to spend time figuring out what needs to be installed to set up a working environment. Whenever a package is installed or updated, the required dependencies will be also automatically fetched, if necessary. As a result, packages can be installed with the usual package manager that is provided by the Linux distribution in the usual way (page 404 of the `Administrator Manual`).

For example, the administrator can install `cm-pytorch-py37-cuda10.2-gcc8` as follows:

Example

```
[root@bright81 ~]# yum install cm-pytorch-py37-cuda10.2-gcc8  #on RHEL 7
[root@bright81 ~]# zypper install cm-pytorch-py37-cuda10.2-gcc8  #on SLES 15
[root@bright81 ~]# apt-get install cm-pytorch-py37-cuda10.2-gcc8  #on Ubuntu 18.04
```

The package managers also automatically install the corresponding dependencies, such as

- `cm-ml-distdeps-cuda10.2`
- `cm-ml-pythondeps-py37-cuda10.2-gcc8`
- `cm-protobuf3-gcc8`
- `cudnn7.6-cuda10.2`
- `cm-nccl2-cuda10.2-gcc8`

Machine learning packages share several dependencies, usually providing useful Python or system libraries. For convenience, these dependencies are grouped in the `cm-ml-pythondeps-*` and `cm-ml-distdeps-*` meta-packages.

- `cm-ml-pythondeps-*`: This meta-package provides the application libraries such as `numba`, `numpy`, `scikit-learn`, and `scipy`. © Bright Computing, Inc.
• cm-ml-distdeps-*: This meta-package, on the other hand, provides development libraries such as blas-devel, libjpeg-devel and libpng-devel, and the utility library gnuplot.

The appropriate meta-packages are automatically installed whenever a package installation requires it.

Administrators only need to make sure that their clusters meet the preceding hardware requirements listed at the start of section 1.3. If that is not done, then unexpected failures may occur during run time, such as segmentation faults.

Examples of common mistakes are

• using packages requiring CUDA (e.g. cm-pytorch-py37-cuda10.2-gcc8) on clusters without GPUs

• using packages requiring VNNI (e.g. cm-tensorflow-py37-mkl-gcc8) on CPUs not supporting the instruction set

Compute Nodes Installation
The cm-ml-distdeps-* meta-packages must be also installed onto all compute nodes that are to run machine learning applications.

For example, if the name of the software image is gpu-image, then the administrator can install cm-ml-distdeps-cuda10.2 on RHEL 7 as follows:

Example

[root@bright81 ~]# yum install --installroot=/cm/images/gpu-image cm-ml-distdeps-cuda10.2

The preceding command must be applied to all software images that are used to run machine learning applications.

There are equivalents to the --installroot option of yum for the other distribution package managers.

For SLES the installation command equivalent is:

[root@bright81 ~]# zypper --root /cm/images/gpu-image install cm-ml-distdeps-cuda10.2

For Ubuntu the installation command equivalent is:

[root@bright81 ~]# chroot /cm/images/gpu-image
[root@bright81 ~]# apt install cm-ml-distdeps-cuda10.2
[root@bright81 ~]# exit #get out of chroot

Details on using zypper and apt commands for installation to software images are given on page 404 of the Administrator Manual.

The preceding command must be applied to all software images that are used to run machine learning applications.

No automatic install of cuda-driver and cuda-dcgm since cm-ml-distdeps-cuda-* v3.0.0: The cuda-driver and cuda-dcgm packages used to be automatically installed during installation of earlier versions of the cm-ml-distdeps-cuda-* meta-package. This behavior has changed.

Version 3.0.0 onward of the package requires a manual install of the cuda-driver and cuda-dcgm packages. Installation of the cuda-driver and cuda-dcgm packages is covered in section 7.5.1 of the Installation Manual.

The version number of the available or installed cm-ml-distdeps-cuda* package can be found with yum info:

Example
The manual installation of the cuda-driver and cuda-dcgm packages allows a wider range of NVIDIA drivers and cluster configurations to be installed. Version 3.0.0 onward now allows the administrator to install custom NVIDIA drivers, for example for special hardware such as DGX machines. It also allows the administrator to install different versions of NVIDIA drivers for different groups of compute nodes.

Just as for the cm-ml-distdeps-* meta-packages, the custom NVIDIA drivers must be installed onto all the compute nodes that are to run machine learning applications.

### 1.4.1 Module Loading

Bright Cluster Manager provides environment module definitions for all the machine learning packages. The environment module files are also compatible with the Lmod software introduced in Bright Cluster Manager 7.3. They can be listed once the shared module is loaded, if it has not already been loaded:

```
[root@bright81 ~]# module purge; module available

For example, after having installed the `cm-tensorflow2-py37-cuda10.2-gcc8` package, the associated TensorFlow module can be loaded with:

```
[root@bright81 ~]# module load tensorflow2-py37-cuda10.2-gcc8
Loading tensorflow2-py37-cuda10.2-gcc8/2.4.1
Loading requirement: openblas/dynamic/0.3.7 hdf5_18/1.8.21 gcc8/8.4.0 python37
  cuda10.2/toolkit/10.2.89 cudnn7.6-cuda10.2/7.6.5.32
  ml-pythondeps-py37-cuda10.2-gcc8/4.4.2 protobuf3-gcc8/3.10.1 nccl2-cuda10.2-gcc8/2.8.4
```

The machine learning environment modules automatically load additional environment modules as dependencies, with the notable exception of Open MPI implementations for the reasons given in section 1.2.1.

The module dependencies are achieved via the module definition files:

Example

```
[root@bright81 ~]# module show tensorflow2-py37-cuda10.2-gcc8
-------------------------------------------------------------------
/cm/shared/modulefiles/tensorflow2-py37-cuda10.2-gcc8/2.4.1:
module-whatis  adds TensorFlow2 to your environment variables

-------------------------------------------------------------------
```

1.5 Machine Learning Packages Removal

Machine learning packages can be removed in the usual way with the package manager commands used by the Linux distribution. For example, the administrator can remove the `cm-pytorch-py37-cuda10.2-gcc8` package with:

Example

```
[root@bright81 ~]# yum remove cm-pytorch-py37-cuda10.2-gcc8  # on RHEL 7
or
[root@bright81 ~]# zypper remove cm-pytorch-py37-cuda10.2-gcc8  # on SLES 15
or
```
Bright Cluster Manager machine learning packages are installed in the /cm/shared directory, which is by default exported over NFS. Packages removed from the head node are therefore also removed from all the compute nodes by default.

The cm-ml-distdeps-* meta-packages must be also removed from all compute nodes that are to run machine learning applications. For example, if the name of the software image is gpu-image, then the images directory is /cm/images/gpu-image, and then the administrator can remove cm-ml-distdeps-cuda10.2 from the image as follows in RHEL 7:

Example

[root@bright81 ~]# yum remove --installroot=/cm/images/gpu-image cm-ml-distdeps-cuda10.2

The preceding command must be applied to all software images that are used to run the machine learning applications.

The equivalents to the --installroot option of yum for the other distribution package managers are described in section 1.4.
Running TensorFlow

This chapter goes through some example runs with TensorFlow. Some output messages have been removed or simplified in the runs for readability.

The sample runs assume that TensorFlow and its extra libraries have been installed from the Bright Cluster Manager repository with a package manager. For example with

```
yum install cm-tensorflow2-py37-cuda10.2-gcc8 cm-tensorflow2-extra-py37-cuda10.2-gcc8
```

In addition to requiring the extra libraries, TensorFlow requires an OpenMPI implementation to work. Chapter 3 of the User Manual describes the different OpenMPI packages that the Bright repositories provide. The different OpenMPI packages allow the user to choose which one to use. For example, depending on which interconnect is being used, or depending on if CUDA support is required.

In this chapter, the `cm-openmpi4-cuda10.2-ofed50-gcc8` package is used.

More information on the examples can be found at [https://github.com/tensorflow/examples](https://github.com/tensorflow/examples).

### 2.1 Hello World

A “Hello World” interactive example that just shows that the software is in place for TensorFlow can be run as follows:

**Example**

```
[root@bright81 ~]# module load shared
[root@bright81 ~]# module load tensorflow2-py37-cuda10.2-gcc8
[root@bright81 ~]# module load openmpi4-cuda10.2-ofed50-gcc8
[root@bright81 ~]# python3.7
Python 3.7.9 (default, Mar 1 2021, 14:10:18)
[GCC 10.2.0] on linux
Type "help", "copyright", "credits" or "license" for more information.
>>> import tensorflow as tf

```
2.2 Deep Convolutional Generative Adversarial Network

The following trains a deep convolutional generative adversarial network (DCGAN).

The example code is included in the TensorFlow extra package. Once its module has been loaded, the example directory is defined with the `CM_TENSORFLOW2_EXTRA` environment variable.

The example picks up training images and labels from the MNIST site, and places them in a directory `tensorflow_datasets/` if it needs to. The images are then used to train the model. End users would be expected to train the neural network within their home directories.

Example

```
[root@bright81 ~]# module load tensorflow2-extra-py37-cuda10.2-gcc8
[root@bright81 ~]# module load openmpi4-cuda10.2-ofed50-gcc8
[root@bright81 ~]# cd ${CM_TENSORFLOW2_EXTRA}/tensorflow_examples/models/dcgan/
[root@bright81 dcgan]# python3.7 dcgan.py --epochs 5
```

© Bright Computing, Inc.
2.3 Image-to-Image Translation with Conditional Adversarial Nets

The following trains a conditional adversarial networks as a general-purpose solution to image-to-image translation problems. The trained model is capable of completing different tasks, such as colorizing black and white photos.

The example code is included in the TensorFlow extra package. Once its module has been loaded, the example directory is defined with the `CM_TENSORFLOW2_EXTRA` environment variable.

The example uses a preprocessed copy of the CMP Facade Database, helpfully provided by the Center for Machine Perception at the Czech Technical University in Prague. The original dataset includes 606 rectified images of facades from various sources, which have been manually annotated. The facades are from different cities around the world and diverse architectural styles.

The example conveniently downloads the dataset in a temporary directory and then trains the model. End users would be expected to train the neural network within their home directories.

Example

```
[root@bright81 ~]# module load tensorflow2-extra-py37-cuda10.2-gcc8
[root@bright81 ~]# module load openmpi4-cuda10.2-ofed50-gcc8
[root@bright81 ~]# cd ${CM_TENSORFLOW2_EXTRA}/tensorflow_examples/models/pix2pix/
[root@bright81 pix2pix]# python3.7 data_download.py --download_path /tmp
```

2.4 Neural Machine Translation With Attention

The following trains a sequence to sequence model for neural machine translation with attention using
gated recurrent units (GRUs).

The example code is included in the TensorFlow extra package. Once its module has been loaded,
the example directory is defined with the `CM_TENSORFLOW2_EXTRA` environment variable.

The example conveniently downloads a dataset for Spanish to English translation in a temporary
directory and then trains the model. End users would be expected to train the neural network within
their home directories.

Example

[root@bright81 ~]# module load tensorflow2-extra-py37-cuda10.2-gcc8
[root@bright81 ~]# module load openmpi4-cuda10.2-ofed50-gcc8
[root@bright81 ~]# cd ${CM_TENSORFLOW2_EXTRA}/tensorflow_examples/models/nmt_with_attention/
[root@bright81 nmt_with_attention]# python3.7 train.py --epochs 5 --download_path /tmp

[root@bright81 nmt_with_attention]#
Running PyTorch

This chapter goes through some example runs with PyTorch. Some output messages have been removed or simplified in the runs for readability.

The sample runs assume that PyTorch and its extra libraries have been installed from the Bright Cluster Manager repository with a package manager. For example with:

```
yum install cm-pytorch-py37-cuda10.2-gcc8 cm-pytorch-extra-py37-cuda10.2-gcc8
```

In addition to requiring the extra libraries, PyTorch requires an OpenMPI implementation to work. Chapter 3 of the User Manual describes the different OpenMPI packages that the Bright repositories provide. The different OpenMPI packages allow the user to choose which one to use. For example, depending on which interconnect is being used, or depending on if CUDA support is required.

In this chapter, the cm-openmpi4-cuda10.2-ofed50-gcc8 package is used.

More information on the examples can be found at [https://github.com/pytorch/examples](https://github.com/pytorch/examples).

### 3.1 Variational Autoencoders

The following example shows how to train Variational Autoencoders\(^1\), powerful generative models that can be used for a wide variety of applications.

The example code is included in the PyTorch extra (cm-pytorch-extra--) package. Once its module has been loaded, the example directory is defined with the CM_PYTORCH_EXTRA environment variable.

**Example**

```
[root@bright81 ~]# module load shared
[root@bright81 ~]# module load pytorch-extra-py37-cuda10.2-gcc8
[root@bright81 ~]# module load openmpi4-cuda10.2-ofed50-gcc8
[root@bright81 ~]# cd $(CM_PYTORCH_EXTRA)/vae
```

The Variational Autoencoders network is trained by default for 10 epochs. The required dataset can automatically be downloaded and extracted with:

**Example**

```
[root@bright81 vae]# python3.7 main.py
```

© Bright Computing, Inc.

[root@bright81 vae]#
Jupyter And JupyterHub Usage

This chapter covers the usage of Jupyter and JupyterHub, as well as the possibility to integrate it alongside a Spark deployment within Bright Cluster Manager.

[It should be noted that the version of Jupyter in this chapter is from the time of the initial release of Bright Cluster Manager 8.1 in 2018. Jupyter has been undergoing rapid development, and the material documented in this chapter is therefore deprecated if an up-to-date Jupyter deployment is needed.

Updating the Jupyter software in Bright Cluster Manager 8.1 by bringing in upstream developments would be an unrealistic expenditure of resources, due to significant API changes in CMDaemon beyond Bright Cluster Manager 8.1, among other issues.

Therefore, to use a more up-to-date Jupyter deployment, an upgrade to the latest Bright Cluster Manager version is strongly recommended. The Bright Computing sales team can also be contacted for more information]

Jupyter on its own is single user. However JupyterHub allows it to provide a multi-user service, and is therefore commonly installed with Jupyter. In any case, in Bright Cluster Manager, the package cm-jupyterhub depends upon cm-jupyter, and so in this chapter, Jupyter and JupyterHub will be referred by only JupyterHub.

To be able to use it as multi-user, it is necessary to have JupyterHub. It is possible to install and use Jupyter alone. The package cm-jupyter won’t trigger the installation of cm-jupyterhub. However, this chapter covers the most common case, which is to have them working together. Indeed, the Bright Cluster Manager package cm-jupyter is a dependence of cm-jupyterhub. Therefore, in this chapter, the combination of Jupyter and JupyterHub are conveniently referred to as JupyterHub.

4.1 Installation Options

Bright Cluster Manager provides a cm-jupyterhub-setup script to install JupyterHub and integrate it with Apache Spark.

By default, Jupyter comes with kernels for python2 and python3. cm-jupyterhub-setup can also generate additional kernels for the selected Spark instances. cm-jupyterhub-setup will generate at least 3 kernels, leveraging Apache Toree, for: Scala, PySpark, Spark SQL, and SparkR (only if R is installed). Only Apache Spark versions starting from 2.0.0 are supported.

cm-jupyterhub-setup allows JupyterHub to be independently deployed, and generates Spark kernels. Apache Spark must be already installed (Chapter 5 of the Big Data Deployment Manual).

If Apache Spark is already deployed, users can select the option Deploy and then choose the desired Spark instance. If Apache Spark is deployed after JupyterHub installation, users can re-run cm-jupyterhub-setup in order to generate additional kernels, by selecting the option Integrate.

cm-jupyterhub-setup allows users to set some options via Advanced module configuration:

- c.JupyterHub.port for the proxy port (default: 8000)

© Bright Computing, Inc.
• c.JupyterHub.hub_port for the hub port (default: 8082)

• c.Spawner.env_keep for the environment variables to pass to the spawned process

• User for service for the user to use for running the service (default: root)

`cm-jupyterhub-setup` will set up the proxy to use HTTPS on the selected port, using a self-signed certificate. By default, the `cm-jupyterhub` service will run as root user. The wizard will show a list of users (retrieved via LDAP) to utilize as alternative. This technique is implemented via the `SystemdSpawner` class for JupyterHub and some changes in the `sudoers` configuration. Specifically, CMDaemon will create the file `/etc/sudoers.d/jupyterhub` in order to allow the selected user to spawn processes as the user logged in via the hub.

### 4.1.1 Verifying Jupyter And JupyterHub Installation

After the `cm-jupyterhub` service is started, it can take some time until the service is fully up and running. Even if `systemctl status cm-jupyterhub -l` shows that the service is already running, it can still take some seconds longer start functioning.

At this point, whatever the method that was used to install JupyterHub, the `cm-jupyterhub` service should be running on the nodes. Each node should be accessible via a web browser on port 8000 (figure 4.1):

![Figure 4.1: JupyterHub login screen](https://example.com/jupyterhub.png)
4.2 Creating And Running A Notebook

Any user registered in the Linux-PAM system can log in to JupyterHub. For example, a test user jupyterhubuser with password pw1 can be created with:

Example

[root@bright81 ~]# cmsh -c "user ; add jupyteruser ; set password pw1 ; commit "

To be able to access the HDFS in the case of integrated deployment with Spark Yarn, this user has to be granted access. Access can be granted with the cm-hadoop-user utility, for a given instance hdfs1, with:

Example

[root@bright81 ~]# cd /cm/local/apps/cluster-tools/hadoop
[root@bright81 hadoop]# cm-hadoop-user --grant jupyteruser=hdfs1

A login can then be carried out for the test user in the JupyterHub screen. The user is forwarded to a Jupyter instance (figure 4.2):

![JupyterHub landing screen](image)

Figure 4.2: JupyterHub landing screen

Clicking on the New button of figure 4.2 displays a list of kernels (figure 4.3):
Figure 4.3: JupyterHub kernel list

The two first kernels in figure 4.3, Python 2 and Python 3, are default kernels. At least one of them will be present.

The remaining ones in the example were installed using the integration methods. If Python 3 is chosen, then a notebook can be created for it (figure 4.4):

A simple Python 3 code, such as `print('Hello')` can be typed in the text entry box and run (figure 4.5):
4.2 Creating And Running A Notebook

Figure 4.5: Sample Python 3 notebook: Run

It is not possible to import `pyspark` here, because the kernel does not know about the Spark deployment location:

Figure 4.6: Sample Python 3 notebook: PySpark import not possible

The notebook can be closed by clicking on File and Close and Halt.

If the user has any kernel for a Spark deployment, then a notebook can be created for it. In this case, no error is shown after importing `pyspark`, or even accessing the Spark context automatically created by Spark directly (figure 4.7):

© Bright Computing, Inc.
Figure 4.7: Sample integrated Spark notebook: successful import PySpark/access Spark context

That same context is available in all Toree kernels, such as the Scala one:

Figure 4.8: Sample integrated Spark notebook: successful access Spark context with Scala

Extra caution is required with the SQL Toree kernel, as of the writing of this chapter. The kernel hangs if given invalid SQL queries. This is an open issue at https://issues.apache.org/jira/browse/TOREE-419 at the time of writing of this section (May 2018).

4.3 An Example Of A Notebook Connecting To Spark: Word2Vec

If JupyterHub deployment has been carried out as in the preceding sections, and it has been verified and its notebook creation capability checked, then it should be ready for use. An example run is now carried out in this section.

The machine learning library code Word2Vec at https://spark.apache.org/docs/latest/mllib-feature-extraction.html#word2vec takes a dataset of words, and outputs a set of words that can be used in similar contexts. All that is needed is to place the sample data file in a location that both jupyteruser and Spark users can access.

To run the example, a Python programming language, and a Spark standalone deployment, are chosen. The kernel PySpark for Spark standalone is an appropriate choice. The preparation can be carried out as follows:

Example

```
[root@bright81 ~]# su - jupyteruser
[root@bright81 ~]# wget http://mattmahoney.net/dc/text8.zip
[root@bright81 ~]# unzip text8.zip
[root@bright81 ~]# truncate -s 10000000 text8 # truncate to 9.6 MB file
[root@bright81 ~]# sudo su - spark ls $PWD/text8 # ensure spark user can access it
[root@bright81 ~]#
```
4.3 An Example Of A Notebook Connecting To Spark: Word2Vec

The ` truncate` step ensures the file is small enough to run in a cluster with few resources. Truncation can be skipped for clusters that can run large enough instances.

Instead of PySpark and Spark standalone, Scala and Spark YARN could have been chosen instead. In this case, the file should be uploaded to the HDFS. To use a bare Python 2 or Python 3 kernel, the user must also take care to obtaining the context `sc`, which is set automatically by the integrated kernels.

**ConcreteExampleWord2Vec**

![Interactive Notebook](jupyter.png)

**Figure 4.9: Word2Vec Example**

Cell 1 shows that the `sc` context is properly set. The Spark RDD is created in cell 3 using the source file as input.

Cell 2 shows the Word2Vec model factory being imported. It takes the Spark RDD to create `Word2VecModel` in cell 5. This is where intensive computation is carried out, and the user may expect significant latency, as indicated by an asterisk [*], depending on the cluster and RDD size. If no errors as cell 2 to 5 are processed, then no output is expected.

Cell 6 shows the output of `model`, and ensures all is well.

Cell 7 shows the already-computed model is queried to fetch 5 synonyms for the word `one`. Synonyms in the context of Word2Vec can differ from the concept as understood by humans.

Cell 8 the synonym output is shown, along with correlation coefficients. The synonyms are `nine`, `eight`, `seven`, `six`, `and` three.
4.4 Removal Of JupyterHub

Before removing JupyterHub, the administrator should ensure that all kernels have been halted and that no user is still logged onto cm-jupyterhub. Stopping cm-jupyterhub services with users that are still logged in, or with running kernels, has undefined behavior.

When removing a Spark instance, the corresponding Jupyter kernels will be removed, but not Jupyter-Hub itself, as in the following example.

Example

```
[root@bright81 ~]# cm-spark-setup -u hdfs1
Undoing Jupyter, JupyterHub and Toree integration... done.
Stopping/removing services... done.
Removing module file... done.
Removing configuration directory... done.
Cleaning ZooKeeper... done.
Removing additional Spark directories... done.
Removing Spark-related metrics... done.
Removal successfully completed.
Finished.
```

Conversely, in order to remove JupyterHub, the script cm-jupyterhub-setup must be run, either in interactive mode, or with the option --remove.

In any case, for a complete cleanup, the following packages must be removed: cm-jupyterhub, cm-jupyter, cm-npm-configurable-http-proxy.
