Rights and Restrictions
All statements, specifications, recommendations, and technical information contained herein are current or planned as of the date of publication of this document. They are reliable as of the time of this writing and are presented without warranty of any kind, expressed or implied. Bright Computing, Inc. shall not be liable for technical or editorial errors or omissions which may occur in this document. Bright Computing, Inc. shall not be liable for any damages resulting from the use of this document.

Limitation of Liability and Damages Pertaining to Bright Computing, Inc.
The Bright Cluster Manager product principally consists of free software that is licensed by the Linux authors free of charge. Bright Computing, Inc. shall have no liability nor will Bright Computing, Inc. provide any warranty for the Bright Cluster Manager to the extent that is permitted by law. Unless confirmed in writing, the Linux authors and/or third parties provide the program as is without any warranty, either expressed or implied, including, but not limited to, marketability or suitability for a specific purpose. The user of the Bright Cluster Manager product shall accept the full risk for the quality or performance of the product. Should the product malfunction, the costs for repair, service, or correction will be borne by the user of the Bright Cluster Manager product. No copyright owner or third party who has modified or distributed the program as permitted in this license shall be held liable for damages, including general or specific damages, damages caused by side effects or consequential damages, resulting from the use of the program or the un-usability of the program (including, but not limited to, loss of data, incorrect processing of data, losses that must be borne by you or others, or the inability of the program to work together with any other program), even if a copyright owner or third party had been advised about the possibility of such damages unless such copyright owner or third party has signed a writing to the contrary.

Welcome to the Machine Learning Manual for Bright Cluster Manager 9.0.

0.1 About This Manual
This manual is aimed at helping cluster administrators install, understand, configure, and manage basic machine learning capabilities easily using Bright Cluster Manager. The administrator is expected to be reasonably familiar with the Administrator Manual.

0.2 About The Manuals In General
Regularly updated versions of the Bright Cluster Manager 9.0 manuals are available on updated clusters by default at /cm/shared/docs/cm. The latest updates are always online at http://support.brightcomputing.com/manuals.

- The Installation Manual describes installation procedures for a basic cluster.
- The Administrator Manual describes the general management of the cluster.
- The User Manual describes the user environment and how to submit jobs for the end user.
- The Cloudbursting Manual describes how to deploy the cloud capabilities of the cluster.
- The Developer Manual has useful information for developers who would like to program with Bright Cluster Manager.
- The OpenStack Deployment Manual describes how to deploy OpenStack with Bright Cluster Manager.
- The Edge Manual describes how to deploy Bright Edge with Bright Cluster Manager.

If the manuals are downloaded and kept in one local directory, then in most pdf viewers, clicking on a cross-reference in one manual that refers to a section in another manual opens and displays that section in the second manual. Navigating back and forth between documents is usually possible with keystrokes or mouse clicks.

For example: <Alt>-<Backarrow> in Acrobat Reader, or clicking on the bottom leftmost navigation button of xpdf, both navigate back to the previous document.

The manuals constantly evolve to keep up with the development of the Bright Cluster Manager environment and the addition of new hardware and/or applications. The manuals also regularly incorporate customer feedback. Administrator and user input is greatly valued at Bright Computing. So any comments, suggestions or corrections will be very gratefully accepted at manuals@brightcomputing.com.

There is also a feedback form available via Bright View, via the Account icon, following the clickpath:
Account→Help→Feedback
0.3 Getting Administrator-Level Support

If the reseller from whom Bright Cluster Manager was bought offers direct support, then the reseller should be contacted.

Otherwise the primary means of support is via the website https://support.brightcomputing.com. This allows the administrator to submit a support request via a web form, and opens up a trouble ticket. It is a good idea to try to use a clear subject header, since that is used as part of a reference tag as the ticket progresses. Also helpful is a good description of the issue. The followup communication for this ticket goes via standard e-mail. Section 13.2 of the Administrator Manual has more details on working with support.

0.4 Getting Professional Services

Bright Computing normally differentiates between professional services (customer asks Bright Computing to do something or asks Bright Computing to provide some service) and support (customer has a question or problem that requires an answer or resolution). Professional services can be provided after consulting with the reseller, or the Bright account manager.
1

Introduction And Machine Learning Packages Installation

1.1 Introduction

From Bright Cluster Manager version 7.3 onward, a number of machine learning and deep learning library and framework packages can be used. The packages provided make it faster and easier for organizations to install the latest state-of-the-art libraries, and gain insights from rich, complex data.

1.1.1 Bright Cluster Manager Versions—Associated Repositories And Support For Machine Learning Packages

- In Bright Cluster Manager versions 7.3 and 8.0 the machine learning and deep learning packages are experimentally accessible to a cluster from the standard Bright cm repository. However, from Bright Cluster Manager version 8.1 onward, these packages are distributed via a separate Bright cm-ml repository.

- In Bright Cluster Manager versions 8.1 and 8.2, cluster administrators have to activate the Data Science Add-on using the online wizard at:

  The add-on enables the dedicated Bright cm-ml repository.

- From Bright Cluster Manager version 9.0 onward the activation step via a wizard is not needed—the repository is automatically available and enabled.

Only if the cluster is licensed for the Data Science Add-on package does Bright provide support for the integration of packages distributed in the dedicated repository with Bright Cluster Manager.

For convenience, a summary of the Bright for Data Science (B4DS) repository configuration requirements is shown in table 1.1:
An administrator who is upgrading a cluster that has machine learning and deep learning packages installed on it should always make sure that the dedicated Bright cm-ml repository is accessible, if required by the new Bright Cluster Manager version.

### 1.1.2 Bright Cluster Manager Versions—Supported Distributions And Architecture For Machine Learning Packages

At the time of writing, October 2020, a number of different Linux distribution versions and architectures are supported, depending on the Bright Cluster Manager version. For convenience, a support matrix for this is shown in table 1.2:

<table>
<thead>
<tr>
<th>Bright CM</th>
<th>Architectures</th>
<th>Linux distributions</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.3</td>
<td>x86_64</td>
<td>CentOS 7, RHEL 7, SLES 12</td>

</tbody>
</table>

An updated list of the supported Linux distributions and architectures available for the various Bright Cluster Manager versions can be found at [https://support.brightcomputing.com/feature-matrix/](https://support.brightcomputing.com/feature-matrix/), in the section of the Feature column dedicated to machine learning.

### 1.2 Available Packages

An updated list of the machine learning packages available for the various Bright Cluster Manager versions can be found at [https://support.brightcomputing.com/packages-dashboard/](https://support.brightcomputing.com/packages-dashboard/). Most of the machine learning packages are to be found within the ml group. However, some of them are found within the cm group for legacy reasons.

At the time of writing, October 2020, the following packages were available:
### Table 1.3: Machine Learning packages provided by the Bright Cluster Manager repositories

<table>

1.2 Available Packages

Table 1.3: Machine Learning Packages Included...continued

<table>
<thead>
<tr>
<th>Package name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Package are available for every distribution unless otherwise tagged.</td>
</tr>
</tbody>
</table>

Examples:
- cm-bazel is available for every distribution.
- cm-chainer-py37-cuda10.1-gcc (R7) is only available for RHEL7.

1.2.1 Considerations

There are some considerations that the cluster administrator should be aware of with the packages.

- Some packages may be labelled in the table 1.3 as deprecated. “Deprecated” in the software industry is not a well-defined term. Here it is used by Bright Computing to mean a package that may no longer be offered in a future release, or for which a newer existing version is preferred.

- Several different packages may be provided for the same machine learning library or framework. For example, TensorFlow may be provided by:
  - cm-tensorflow-py36-cuda10.1-gcc or
  - cm-tensorflow-py37-mkl-gcc8

As is the norm with other package management systems in the software industry, the name given to a Bright Computing package includes the most relevant dependencies required to build and use it. The dependencies commonly highlighted in this manner are:

- Python interpreter version used (e.g. *-py36* and *-py37*)
- accelerator library used (e.g. *-cuda10.1* and *-mkl*)
- compiler used (e.g. *-gcc* and *-gcc8*)

The availability of different variants of the same package makes it easier for administrators to set up a working environment that is suited to their needs.

- Machine learning packages are designed to coexist, and can therefore all be installed at the same time. This also applies to different variants of the same library or framework.

  This means that administrators can install different versions of the same machine learning library or framework, simply by using different variants. For example: an older *-py36* version of TensorFlow, as well as a more recent *-py37* version of TensorFlow, can both be installed at the same time.

- As is done with other packages provided by Bright Computing, the updates released for machine learning libraries and frameworks generally leave their major versions unchanged.

  Whenever a major version for a third party machine learning library or a framework is publicly released, a new package or a set of packages is typically placed in the repository.

  Such package(s) imply or contain a reference to the major version in the name. For example:
  - cm-tensorflow-* is the name used for TensorFlow major version 1
  - cm-tensorflow2-* is the name for TensorFlow major version 2

  As a result, administrators can safely upgrade cluster packages without breaking backward compatibility with users’ applications.
• MPI modules and libraries should not be blindly added by the cluster administrator. During module loading, warnings are typically given to suggest an MPI library (Open MPI, or an MPICH or MVAPICH implementation of Open MPI) is required. However, the exact implementation of the MPI library that can be used depends upon the hardware (GPU, interface, architecture) used and requires judgment of suitability by the cluster administrator. Bright Cluster Manager uses the cm-openmpi-geib-cuda10.1-gcc package in this manual as the reference MPI library implementation. This driver package corresponds with using Open MPI with Gigabit Ethernet and InfiniBand networking, NVIDIA GPUs, and x86 architecture.

1.3 Requirements

The following requirements must be met before installing the preceding machine learning packages.

• RHEL users must have access to the YUM repositories and EPEL repository.
• There must be enough free space for the packages that are installed on the head node and compute nodes. The actual amount depends on the packages installed.
• 8 GB of RAM on the nodes is the minimum recommended amount.
• In order to use packages built with the CUDA toolkit accelerator library (i.e. *-cuda*), the NVIDIA GPUs must be Maxwell or more recent, with compute capability 3.5 or later. CUDA compute capability 6.0 or later is recommended.
• In order to use packages built with GCC 5 as compiler (i.e. *-gcc*), the CPU must support the AVX/AVX2, FMA, and SSE4.2 instructions. This can be checked by inspecting the CPU flags:

Example

```
[root@node ~]# egrep -m1 -o '(avx|avx2|fma|sse4_2)' /proc/cpuinfo
fma
sse4_2
avx
avx2
```

• In order to use packages built using MKL as the accelerator (i.e. *-mkl*), the CPU must support the AVX-512 Vector Neural Network Instructions (VNNI). Examples of such CPUs are Intel Xeon Scalable processors with Deep Learning Boost.

1.4 Machine Learning Packages Installation

Head Node Installation

Bright Cluster Manager machine learning packages are installed in the /cm/shared directory, which is by default exported over NFS. Packages installed on the head node are therefore also available to all the compute nodes by default.

The .rpm and .deb files have proper dependencies defined. This means that the cluster administrator does not need to spend time figuring out what needs to be installed to set up a working environment. Whenever a package is installed or updated, the required dependencies will be also automatically fetched, if necessary. As a result, packages can be installed with the usual package manager that is provided by the Linux distribution in the usual way (page 435 of the Administrator Manual).

For example, the administrator can install cm-pytorch-py36-cuda10.1-gcc as follows:

Example
1.4 Machine Learning Packages Installation

The package managers also automatically install the corresponding dependencies, such as

- `cm-ml-distdeps-cuda10.1`
- `cm-ml-pythondeps-py36-cuda10.1-gcc`
- `cm-protobuf3-gcc`
- `cuda10.1-toolkit`
- `cm-cudnn7.6-cuda10.1`
- `cm-nccl2-cuda10.1-gcc`

Machine learning packages share several dependencies, usually providing useful Python or system libraries. For convenience, these dependencies are grouped in the `cm-ml-pythondeps-*` and `cm-ml-distdeps-*` meta-packages.

- `cm-ml-pythondeps-*`: This meta-package provides the application libraries such as `numba`, `numpy`, `scikit-learn`, and `scipy`.
- `cm-ml-distdeps-*`: This meta-package, on the other hand, provides development libraries such as `blas-devel`, `libjpeg-devel` and `libpng-devel`, and the utility library `gnuplot`.

The appropriate meta-packages are automatically installed whenever a package installation requires it.

Administrators only need to make sure that their clusters meet the preceding hardware requirements listed at the start of section 1.3. If that is not done, then unexpected failures may occur during run time, such as segmentation faults.

Examples of common mistakes are

- installing packages requiring CUDA (e.g. `cm-pytorch-py36-cuda10.1-gcc`) on clusters without GPUs
- installing packages requiring VNNI (e.g. `cm-tensorflow-py36-mkl-gcc8`) on CPUs not supporting the instruction set

Compute Nodes Installation

The `cm-ml-distdeps-*` meta-packages must be also installed onto all compute nodes that are to run machine learning applications.

For example, if the name of the software image is `gpu-image`, then the administrator can install `cm-ml-distdeps-cuda10.1` on RHEL 7 as follows:

Example

```
[root@bright90 ~]# yum install --installroot=/cm/images/gpu-image cm-ml-distdeps-cuda10.1
```

The preceding command must be applied to all software images that are used to run machine learning applications.

There are equivalents to the `--installroot` option of `yum` for the other distribution package managers.

For SLES the installation command equivalent is:

© Bright Computing, Inc.
For Ubuntu the installation command equivalent is:

```bash
[root@bright90 ~]# cm-chroot-sw-img /cm/images/gpu-image
[root@bright90 ~]# apt install cm-ml-distdeps-cuda10.1
[root@bright90 ~]# exit  # get out of chroot
```

Details on using zypper and apt commands for installation to software images are given on page 11.2.1 of the Administrator Manual.

The preceding command must be applied to all software images that are used to run machine learning applications.

### 1.4.1 Module Loading

Bright Cluster Manager provides environment module definitions for all the machine learning packages. The environment module files are also compatible with the Lmod software introduced in Bright Cluster Manager 7.3. They can be listed once the shared module is loaded, if it has not already been loaded:

```bash
[root@bright90 ~]# module purge; module available
```

```
---------------------------------- /cm/local/modulefiles ----------------------------------
cluster-tools/9.0  cmd  freeipmi/1.6.4  lua/5.3.5  null  openldap
cluster-tools/9.0  cmd  lua/5.3.5  null  openldap
cluster-tools/9.0  cmjob  gcc/9.2.0  module-git  python3
cm-image/9.0  cmjob  gcc/9.2.0  module-git  python3
cm-scale/cm-scale.module  cmsh  ipmitool/1.8.18  module-info  python37
cm-setup/9.0  cmsh  lua/5.3.5  null  shared
[root@bright90 ~]# module load shared; module available
```

```
---------------------------------- /cm/local/modulefiles ----------------------------------
cluster-tools/9.0  cmd  freeipmi/1.6.4  lua/5.3.5  null  openldap
cluster-tools/9.0  cmd  lua/5.3.5  null  openldap
cluster-tools/9.0  cmjob  gcc/9.2.0  module-git  python3
cm-image/9.0  cmjob  gcc/9.2.0  module-git  python3
cm-scale/cm-scale.module  cmsh  ipmitool/1.8.18  module-info  python37
cm-setup/9.0  cmsh  lua/5.3.5  null  shared
```

```
---------------------------------- /cm/shared/modulefiles ---------------------------------
blacs/openmpi/gcc/64/1.1patch03  hpl/2.2
blas/gcc/64/3.8.0  hwloc/1.11.11
bonnie++/1.98  intel-tbb-oss/ia32/2019_20191006oss
cm-image/master  intel-tbb-oss/intel64/2019_20191006oss
cm-pmix3/3.1.4  iozone/3.487
CUDA10.1/blas/10.1.243  keras-py36-cuda10.1-gcc/2.3.1
CUDA10.1/fft/10.1.243  lapack/gcc/64/3.8.0
CUDA10.1/nsight/10.1.243  ml-pythondeps-py36-cuda10.1-gcc/3.0.0
CUDA10.1/profiler/10.1.243  mpmich/ge/gcc/64/3.3
CUDA10.1/totokit/10.1.243  mvapich2/gcc/64/2.3
CUDA10.1/totokit/10.1.243  nvcc2-cuda10.1-gcc/2.4.8
default-environment  netcdf/gcc/64/4.6.1
FFTW2/openmpi/gcc/64/double/2.1.5  netperf/2.7.0
FFTW2/openmpi/gcc/64/float/2.1.5  openblas/dynamic/(default)
FFTW3/openmpi/gcc/64/3.3.8  openblas/dynamic/0.2.20
gcc5/5.5.0  openmpi/gcc/64/1.10.7
gdb/3.3.1  protobuf3-gcc/3.10.1
globalarrays/openmpi/gcc/64/5.7  scalapack/openmpi/gcc/64/2.0.2
hdf5/1.10.1  tensorflow-py36-cuda10.1-gcc/1.14.0
hdf5_18/1.8.20  uci/1.6.1
```

For example, after having installed the cm-tensorflow-py36-cuda10.1-gcc package, the associated TensorFlow module can be loaded with:
1.5 Machine Learning Packages Removal

Machine learning packages can be removed in the usual way with the package manager commands used by the Linux distribution. For example, the administrator can remove the `cm-pytorch-py36-cuda10.1-gcc` package with:

**Example**

```bash
[root@bright90 ~]# yum remove cm-pytorch-py36-cuda10.1-gcc  #on RHEL 7
```

or

```bash
[root@bright90 ~]# zypper remove cm-pytorch-py36-cuda10.1-gcc  #on SLES 15
```

or

```bash
[root@bright90 ~]# apt-get remove cm-pytorch-py36-cuda10.1-gcc #on Ubuntu 18.04
```
Bright Cluster Manager machine learning packages are installed in the /cm/shared directory, which is by default exported over NFS. Packages removed from the head node are therefore also removed from all the compute nodes by default.

The cm-ml-distdeps-* meta-packages must be also removed from all compute nodes that are to run machine learning applications. For example, if the name of the software image is gpu-image, then the images directory is /cm/images/gpu-image, and then the administrator can remove cm-ml-distdeps-cuda10.1 from the image as follows in RHEL 7:

**Example**

[root@bright90 ~]# yum remove --installroot=/cm/images/gpu-image cm-ml-distdeps-cuda10.1

The preceding command must be applied to all software images that are used to run the machine learning applications.

The equivalents to the --installroot option of yum for the other distribution package managers are described in section 1.4.
This chapter goes through some example runs with TensorFlow. Some output messages have been removed in the runs for readability.

It assumes TensorFlow has been installed, with, for example, `yum install cm-tensorflow-py36-cuda10.1-gcc`.

In addition, TensorFlow requires an OpenMPI implementation to work. As described in Chapter 3 of the *User Manual*, the Bright repositories provide different OpenMPI packages. This allows the user to choose which one to use, depending on, for example, which interconnect is being used, or if CUDA support is required.

In this chapter, the `cm-openmpi-geib-cuda10.1-gcc` package is used.

### 2.1 Hello World

A “Hello World” interactive example that just shows that the software is in place for TensorFlow can be run as follows:

**Example**

```bash
[root@bright90 ~]# module load shared
[root@bright90 ~]# module load tensorflow-py36-cuda10.1-gcc
[root@bright90 ~]# module load openmpi-geib-cuda10.1-gcc
[root@bright90 ~]# python3.6
Python 3.6.9 (default, Nov 20 2019, 21:00:07)
[GCC 4.8.5 20150623 (Red Hat 4.8.5-28)] on linux
Type "help", "copyright", "credits" or "license" for more information.
>>> import tensorflow as tf
>>> hello = tf.constant('Hello, TensorFlow!')
>>> sess = tf.Session()
```

```
name: Tesla K40c major: 3 minor: 5 memoryClockRate(GHz): 0.745
pciBusID: 0000:00:08.0
totalMemory: 11.17GiB freeMemory: 11.09GiB
```

```python
>>> sess.run(hello)
b'Hello, TensorFlow!'
```...

```python
>>> a = tf.constant(10)
>>> b = tf.constant(32)
>>> sess.run(a+b)
42
```
2.2 Convolutional Neural Network

The following trains a convolutional neural network similar to LeNet-5.

The code uses the TensorFlow convolutional module at /cm/shared/apps/tensorflow-py36-cuda10.1-gcc/current/models/tutorials/image/mnist/convolutional.py. It picks up training images and labels from the MNIST site, and places them in a directory data if it needs to. The images are then used to train and validate the model. End users would be expected to train the neural network within their home directories.

Example

[root@bright90 ~]# module load tensorflow-py36-cuda10.1-gcc
[root@bright90 ~]# module load openmpi-geib-cuda10.1-gcc
[root@bright90 ~]# cd /cm/shared/apps/tensorflow-py36-cuda10.1-gcc/current/models/tutorials/image/mnist/
[root@bright90 mnist]# python convolutional.py

  Found device 0 with properties:
  name: Tesla K40c major: 3 minor: 5 memoryClockRate(GHz): 0.745
  pciBusID: 0000:00:08.0
  totalMemory: 11.17GiB freeMemory: 11.09GiB
  Initialized!

2.4 Iris Classification

The iris flower data set is a standard raw data set, originally measured by R. A. Fisher in 1936. The data values in the set are a list of, per flower, the petal length and width, and the sepal length and width. Sepals are leaflike "under petals" under the actual petals. Based on these 4 attributes per flower, the fifth attribute—the species that the iris flower belongs to—can be determined. The determination of the species does not have an obvious solution because it depends on multiple variables at the same time. Fisher came up with a mathematical method to determine the species.

In machine learning, the iris flower data set is commonly used to illustrate concepts. An iris classification program, `premade_estimator`, is therefore a core TensorFlow program. The following session shows a run with `premade_estimator`, which downloads the data values used for training if required (some output ellipsized or removed for clarity):

```
[root@bright90 ~]# module load tensorflow-py36-cuda10.1-gcc
[root@bright90 ~]# module load openmpi-geib-cuda10.1-gcc
[root@bright90 ~]# cd /cm/shared/apps/tensorflow-py36-cuda10.1-gcc/current/models/samples/
core/get_started
[root@bright90 get_started]# python premade_estimator.py

Prediction is "Virginica" (97.7%), expected "Virginica"

More information on the program can be found at https://www.tensorflow.org/tutorials/quickstart/beginner.
Running PyTorch

This chapter goes through some example runs with PyTorch. Some output messages have been removed in the runs for readability.

It assumes PyTorch has been installed with a package manager from the Bright Cluster Manager repository. For example with:

```
yum install cm-pytorch-py36-cuda10.1-gcc
```

In addition, PyTorch requires an OpenMPI implementation to work. As described in Chapter 3 of the *User Manual*, the Bright repositories provide different OpenMPI packages. This allows the user to choose which one to use, depending on, for example, which interconnect is being used, or if CUDA support is required.

In this chapter, the `cm-openmpi-geib-cuda10.1-gcc` package is used.

### 3.1 Variational Autoencoders (VAEs)

The following example shows how to train *Variational Autoencoders*\(^1\), powerful generative models that can be used for a wide variety of applications.

The source code is available in the official PyTorch GitHub repository and can be fetched as follows:

```
[root@bright90 ~]# git clone https://github.com/pytorch/examples.git
[root@bright90 ~]# cd examples/
[root@bright90 ~]# git checkout 6c51ca5a614cfdbdcd4e8c3e70321c5f6d6efb177
[root@bright90 ~]# cd vae/
```

The Variational Autoencoders network is trained by default for 10 epochs. The required dataset can automatically be downloaded and extracted with:

```
Example

[root@bright90 ~]# module load shared
[root@bright90 ~]# module load pytorch-py36-cuda10.1-gcc
[root@bright90 ~]# module load openmpi-geib-cuda10.1-gcc
[root@bright90 ~]# python3.6 main.py
```

```
