Preface

Welcome to the *Machine Learning Manual* for NVIDIA Bright Cluster Manager 9.2.

0.1 About This Manual

This manual is aimed at helping cluster administrators install, understand, configure, and manage basic machine learning capabilities easily using NVIDIA Bright Cluster Manager. The administrator is expected to be reasonably familiar with the *Administrator Manual*.

0.2 About The Manuals In General

Regularly updated versions of the NVIDIA Bright Cluster Manager 9.2 manuals are available on updated clusters by default at `/cm/shared/docs/cm`. The latest updates are always online at [http://support.brightcomputing.com/manuals](http://support.brightcomputing.com/manuals).

- The *Installation Manual* describes installation procedures for a basic cluster.
- The *Administrator Manual* describes the general management of the cluster.
- The *User Manual* describes the user environment and how to submit jobs for the end user.
- The *Cloudbursting Manual* describes how to deploy the cloud capabilities of the cluster.
- The *Developer Manual* has useful information for developers who would like to program with the cluster manager.
- The *Edge Manual* describes how to deploy Bright Edge with the cluster manager.
- The *Machine Learning Manual*—this manual—describes how to install and configure machine learning capabilities with the cluster manager.
- The *Containerization Manual* describes how to manage containers with the cluster manager.

If the manuals are downloaded and kept in one local directory, then in most pdf viewers, clicking on a cross-reference in one manual that refers to a section in another manual opens and displays that section in the second manual. Navigating back and forth between documents is usually possible with keystrokes or mouse clicks.

For example: `<Alt>-<Backarrow>` in Acrobat Reader, or clicking on the bottom leftmost navigation button of xpdf, both navigate back to the previous document.

The manuals constantly evolve to keep up with the development of the cluster manager environment and the addition of new hardware and/or applications. The manuals also regularly incorporate customer feedback. Administrator and user input is greatly valued at Bright Computing. So any comments, suggestions or corrections will be very gratefully accepted at manuals@brightcomputing.com.

There is also a feedback form available via Bright View, via the Account icon, following the clickpath:

Account → Help → Feedback
0.3 Getting Administrator-Level Support

If the reseller from whom the cluster manager was bought offers direct support, then the reseller should be contacted.

Otherwise the primary means of support is via the website https://support.brightcomputing.com. This allows the administrator to submit a support request via a web form, and opens up a trouble ticket. It is a good idea to try to use a clear subject header, since that is used as part of a reference tag as the ticket progresses. Also helpful is a good description of the issue. The followup communication for this ticket goes via standard e-mail. Section 16.2 of the Administrator Manual has more details on working with support.

0.4 Getting Professional Services

Bright Computing normally differentiates between professional services (customer asks Bright Computing to do something or asks Bright Computing to provide some service) and support (customer has a question or problem that requires an answer or resolution). Professional services can be provided after consulting with the reseller, or the Bright account manager.
Introduction And Machine Learning Packages Installation

1.1 Introduction
From NVIDIA Bright Cluster Manager version 7.3 onward, a number of machine learning and deep learning library and framework packages can be used. The packages provided make it faster and easier for organizations to install the latest state-of-the-art libraries, and gain insights from rich, complex data.

1.1.1 NVIDIA Bright Cluster Manager Versions—Associated Repositories And Support For Machine Learning Packages

- In NVIDIA Bright Cluster Manager versions 7.3 and 8.0 the machine learning and deep learning packages are experimentally accessible to a cluster from the standard Bright cm repository. However, from NVIDIA Bright Cluster Manager version 8.1 onward, these packages are distributed via a separate Bright cm-ml repository.

- In NVIDIA Bright Cluster Manager versions 8.1 and 8.2, cluster administrators have to activate the Data Science Add-on using the online wizard at:

  The add-on enables the dedicated Bright cm-ml repository.

- From NVIDIA Bright Cluster Manager version 9.0 onward the activation step via a wizard is not needed—the repository is automatically available and enabled.

  Only if the cluster is licensed for the Data Science Add-on package does Bright provide support for the integration of packages distributed in the dedicated repository with the cluster manager.

  For convenience, a summary of the Bright for Data Science (B4DS) repository configuration requirements is shown in table 1.1:
Table 1.1: NVIDIA Bright Cluster Manager overview for Machine Learning packages

</tbody>
</table>

An administrator who is upgrading a cluster that has machine learning and deep learning packages installed on it should always make sure that the dedicated Bright cm-ml repository is accessible, if required by the new NVIDIA Bright Cluster Manager version.

1.1.2 NVIDIA Bright Cluster Manager Versions—Supported Distributions And Architecture For Machine Learning Packages

At the time of writing, December 2021, a number of different Linux distribution versions and architectures are supported, depending on the NVIDIA Bright Cluster Manager version. For convenience, a support matrix for this is shown in table 1.2:

An updated list of the supported Linux distributions and architectures available for the various NVIDIA Bright Cluster Manager versions can be found at [https://support.brightcomputing.com/feature-matrix/](https://support.brightcomputing.com/feature-matrix/), in the section of the Feature column dedicated to machine learning.

1.2 Available Packages

An updated list of the machine learning packages available for the various NVIDIA Bright Cluster Manager versions can be found at [https://support.brightcomputing.com/packages-dashboard/](https://support.brightcomputing.com/packages-dashboard/). Most of the machine learning packages are to be found within the cm group. However, some of them are found within the ml group for legacy reasons.

At the time of writing, December 2021, the following packages were available:

Legend:
- **D**: Deprecated
- **C7**: CentOS 7
- **K8**: Rocky 8
- **K9**: Rocky 9
- **R7**: RHEL 7
- **R8**: RHEL 8
- **R9**: RHEL 9
- **S5**: SLES 15
- **U0**: Ubuntu 20.04
- **U8**: Ubuntu 18.04

Package are available for every distribution unless otherwise tagged.

Examples:
- cm-bazel is available for every distribution.
- cm-chainer-py37-cuda10.1-gcc (R7) is only available for RHEL7.

#### 1.2.1 Considerations

There are some considerations that the cluster administrator should be aware of with the packages.

- Some packages may be labelled in the table 1.3 as deprecated. “Deprecated” in the software industry is not a well-defined term. Here it is used by Bright Computing to mean a package that may no longer be offered in a future release, or for which a newer existing version is preferred.

- Several different packages may be provided for the same machine learning library or framework. For example, TensorFlow may be provided by:
  - cm-tensorflow2-py39-cuda11.2-gcc9
As is the norm with other package management systems in the software industry, the name given to a Bright Computing package includes the most relevant dependencies required to build and use it. The dependencies commonly highlighted in this manner are:

- Python interpreter version used (e.g. *-py36*, *-py37* and *-py39*)
- accelerator library used (e.g. *-cuda10.1*, *-cuda10.2*, *-cuda11.2*, *-cuda11.7*, and *-mkl*)
- compiler used (e.g. *-gcc*, *-gcc8* and *-gcc9*)

The availability of different variants of the same package makes it easier for administrators to set up a working environment that is suited to their needs.

- Machine learning packages are designed to coexist, and can therefore all be installed at the same time. This also applies to different variants of the same library or framework. This means that administrators can install different versions of the same machine learning library or framework, simply by using different variants. For example: an older *-py36* version of TensorFlow, as well as a more recent *-py37* version of TensorFlow, can both be installed at the same time.

- As is done with other packages provided by Bright Computing, the updates released for machine learning libraries and frameworks generally leave their major versions unchanged. Whenever a major version for a third party machine learning library or a framework is publicly released, a new package or a set of packages is typically placed in the repository. Such package(s) imply or contain a reference to the major version in the name. For example:
  - cm-tensorflow-* is the name used for TensorFlow major version 1
  - cm-tensorflow2-* is the name for TensorFlow major version 2

As a result, administrators can safely upgrade cluster packages without breaking backward compatibility with users' applications.

- MPI modules and libraries should not be blindly added by the cluster administrator. During module loading, warnings are typically given to suggest an MPI library (Open MPI, or an MPICH or MVAPICH implementation of Open MPI) is required. However, the exact implementation of the MPI library that can be used depends upon the hardware (GPU, interface, architecture) used and requires judgment of suitability by the cluster administrator. The cluster manager uses the cm-openmpi4-cuda11.2-ofed51-gcc9 package in this manual as the reference MPI library implementation. This driver package corresponds with using Open MPI with Gigabit Ethernet networking, InfiniBand networking, and NVIDIA GPUs.

### 1.3 Requirements

The following requirements must be met before installing the preceding machine learning packages.

- RHEL users must have access to the YUM repositories and EPEL repository.
- There must be enough free space for the packages that are installed on the head node and compute nodes. The actual amount depends on the packages installed.
- 8 GB of RAM on the nodes is the minimum recommended amount.
1.4 Machine Learning Packages Installation

- In order to use packages built with the CUDA toolkit accelerator library version 10.2 and below (e.g. *-cuda10.2*), the NVIDIA GPUs must be Maxwell or more recent, with compute capability 3.5 or later. CUDA compute capability 6.0 or later is recommended.

- In order to use packages built with the CUDA toolkit accelerator library version 11.0 and above (e.g. *-cuda11.2*), the NVIDIA GPUs must be Maxwell or more recent, with compute capability 5.2 or later. CUDA compute capability 6.0 or later is recommended.

- In order to use packages built using CUDA as the accelerator (i.e. *-cuda*), the CPU must support the AVX/AVX2, FMA, and SSE4.2 instructions. This can be checked by inspecting the CPU flags:

  Example

  ```
  [root@node ~]# egrep -m1 -o \'(avx|avx2|fma|sse4_2)\' /proc/cpuinfo
  fma
  sse4_2
  avx
  avx2
  ```

- In order to use packages built using MKL as the accelerator (i.e. *-mkl*), the CPU must support the AVX-512 Vector Neural Network Instructions (VNNI). Examples of such CPUs are Intel Xeon Scalable processors with Deep Learning Boost.

### 1.4 Machine Learning Packages Installation

#### Head Node Installation

The cluster manager machine learning packages are installed in the `/cm/shared` directory, which is by default exported over NFS. Packages installed on the head node are therefore also available to all the compute nodes by default.

The `.rpm` and `.deb` files have proper dependencies defined. This means that the cluster administrator does not need to spend time figuring out what needs to be installed to set up a working environment. Whenever a package is installed or updated, the required dependencies will be also automatically fetched, if necessary. As a result, packages can be installed with the usual package manager that is provided by the Linux distribution in the usual way (page 505 of the Administrator Manual).

For example, the administrator can install `cm-pytorch-py39-cuda11.2-gcc9` as follows:

Example

```
[root@bright92 ~]# yum install cm-pytorch-py39-cuda11.2-gcc9       #on RHEL 7 and 8
[root@bright92 ~]# zypper install cm-pytorch-py39-cuda11.2-gcc9  #on SLES 15
[root@bright92 ~]# apt-get install cm-pytorch-py39-cuda11.2-gcc9  #on Ubuntu 18.04
```

The package managers also automatically install the corresponding package dependencies, such as

- `cm-cudnn8.1-cuda11.2`
- `cm-m1-pythondeps-py39-cuda11.2-gcc9`
- `cm-nccl2-cuda11.2-gcc9`
- `cm-protobuf3-gcc9`
- `cuda11.2-toolkit`
Machine learning packages share several dependencies, usually providing useful Python or system libraries. For convenience, these dependencies are grouped in the `cm-ml-pythondeps-*` and `cm-ml-distdeps-*` meta-packages.

- **cm-ml-pythondeps-**: This meta-package provides the application libraries such as numba, numpy, scikit-learn, and scipy.
  - If RHEL8 is being run, and `cm-ml-pythondeps-py39-cuda11.2-gcc9` is being installed, then the `codeready-builder-for-rhel-8-x86_64-rpms` repository needs to be enabled. For example using:
    ```bash
    subscription-manager repos --enable=codeready-builder-for-rhel-8-x86_64-rpms
    ```

- **cm-ml-distdeps-**: This meta-package, on the other hand, provides development libraries such as blas-devel, libjpeg-devel and libpng-devel, and the utility library gnuplot.

The appropriate meta-packages are automatically installed whenever a package installation requires it.

Administrators only need to make sure that their clusters meet the preceding hardware requirements listed at the start of section 1.3. If that is not done, then unexpected failures may occur during run time, such as segmentation faults.

Examples of common mistakes are

- using packages requiring CUDA (e.g. `cm-pytorch-py39-cuda11.2-gcc9`) on clusters without GPUs
- using packages requiring VNNI (e.g. `cm-tensorflow-py39-cuda11.2-gcc9`) on CPUs not supporting the instruction set

**Compute Nodes Installation**

The `cm-ml-distdeps-*` meta-packages must be also installed onto all compute nodes that are to run machine learning applications.

For example, if the name of the software image is `gpu-image`, then the administrator can install `cm-ml-dist deps-cuda11.2` on RHEL 7 as follows:

**Example**

```
[root@bright92 ~]# yum install --installroot=/cm/images/gpu-image cm-ml-distdeps-cuda11.2
```

The preceding command must be applied to all software images that are used to run machine learning applications.

There are equivalents to the `--installroot` option of `yum` for the other distribution package managers.

For SLES the installation command equivalent is:

```
[root@bright92 ~]# zypper --root /cm/images/gpu-image install cm-ml-distdeps-cuda11.2
```

For Ubuntu the installation command equivalent is:

```
[root@bright92 ~]# cm-chroot-sw-img /cm/images/gpu-image
[root@bright92 chroot]# apt install cm-ml-distdeps-cuda11.2
[root@bright92 chroot]# exit #get out of chroot
```

Details on using `zypper` and `apt` commands for installation to software images are given on page 505 of the *Administrator Manual*.

The preceding command must be applied to all software images that are used to run machine learning applications.
1.4 Machine Learning Packages Installation

No automatic install of cuda-driver and cuda-dcgm since cm-ml-distdeps-cuda-* v3.0.0: The cuda-driver and cuda-dcgm packages used to be automatically installed during installation of earlier versions of the cm-ml-distdeps-cuda-* meta-package. This behavior has changed.

Version 3.0.0 onward of the package requires a manual install of the cuda-driver and cuda-dcgm packages. Installation of the cuda-driver and cuda-dcgm packages is covered in section 7.4.1 of the Installation Manual.

The version number of the available or installed cm-ml-distdeps-cuda* package can be found with the package manager. For example using yum info:

Example

[root@bright92 ~]# yum info cm-ml-distdeps-cuda11.2

... Available Packages
Name : cm-ml-distdeps-cuda11.2
Version : 3.0.1
...

A distribution-agnostic manner to the version is with the packages command (section 11.1.1 of the Administrator Manual):

Example

[bright92->device[bright92]% packages -f cm-ml-distdeps-cuda11.2 -n bright92

Node Type Name Version Release Arch Size
-------- -------- ------------------------ -------- ------------------------ -------- --------
bright92 rpm cm-ml-distdeps-cuda11.2 3.0.1 100092_cm9.2_db74c57a10 x86_64 0B

The manual installation of the cuda-driver and cuda-dcgm packages allows a wider range of NVIDIA drivers and cluster configurations to be installed. Version 3.0.0 onward now allows the administrator to install custom NVIDIA drivers, for example for special hardware such as DGX machines. It also allows the administrator to install different versions of NVIDIA drivers for different groups of compute nodes.

Just as for the cm-ml-distdeps-* meta-packages, the custom NVIDIA drivers must be installed onto all the compute nodes that are to run machine learning applications.

1.4.1 Module Loading

The cluster manager provides environment module definitions for all the machine learning packages. The environment module files are also compatible with the Lmod software introduced in NVIDIA Bright Cluster Manager 7.3. They can be listed once the shared module is loaded, if it has not already been loaded:

[root@bright92 ~]# module purge; module available
-------- -------- ------------------------ -------- ------------------------ -------- --------
boost/1.77.0 cm-setup/9.2 dot luajit openldap
cluster-tools/9.2 cmake-gcc9/3.21.3 freempm/1.6.8 mariadb-libs python3
cm-bios-tools cmd gcc/11.2.0 module-git python39

[root@bright92 ~]# module load shared; module available
-------- -------- ------------------------ -------- ------------------------ -------- --------
boost/1.77.0 cm-setup/9.2 dot luajit openldap
cluster-tools/9.2 cmake-gcc9/3.21.3 freempm/1.6.8 mariadb-libs python3
cm-bios-tools cmd gcc/11.2.0 module-git python39
cm-image/9.2 cmjob ipmitool/1.8.18 module-info shared
For example, after having installed the cm-tensorflow2-py39-cuda11.2-gcc9 package, the associated TensorFlow module can be loaded with:

```
[root@bright92 ~]# module load tensorflow2-py39-cuda11.2-gcc9
```

The machine learning environment modules automatically load additional environment modules as dependencies, with the notable exception of Open MPI implementations for the reasons given in section 1.2.1.

The module dependencies are achieved via the module definition files:

Example

```
[root@bright92 ~]# module show tensorflow2-py39-cuda11.2-gcc9/
```

```
/cm/shared/modulefiles/tensorflow2-py39-cuda11.2-gcc9/2.7.0:
module-whatis {adds TensorFlow2 to your environment variables}
module load ml-pythondeps-py39-cuda11.2-gcc9
module load protobuf3-gcc9
module load cudnn8.1-cuda11.2
module load nccl2-cuda11.2-gcc9
prepend-path PYTHONPATH /cm/shared/apps/tensorflow2-py39-cuda11.2-gcc9/2.7.0/lib/python3.9/
site-packages/
prepend-path PYTHONPATH /cm/shared/apps/tensorflow2-py39-cuda11.2-gcc9/2.7.0/lib64/python3.9/

prepend-path LD_LIBRARY_PATH /cm/shared/apps/tensorflow2-py39-cuda11.2-gcc9/2.7.0/lib/python3.9/
site-packages/tensorflow_core
```
1.5 Machine Learning Packages Removal

Machine learning packages can be removed in the usual way with the package manager commands used by the Linux distribution. For example, the administrator can remove the cm-pytorch-py37-cuda10.2-gcc8 package with:

**Example**

```
[root@bright92 ~]# yum remove cm-pytorch-py37-cuda10.2-gcc8  # on RHEL 7 and 8
```

or

```
[root@bright92 ~]# zypper remove cm-pytorch-py37-cuda10.2-gcc8  # on SLES 15
```

or

```
[root@bright92 ~]# apt-get remove cm-pytorch-py37-cuda10.2-gcc8  # on Ubuntu 18.04, 20.04
```

The cluster manager machine learning packages are installed in the `/cm/shared` directory, which is by default exported over NFS. Packages removed from the head node are therefore also removed from all the compute nodes by default.

The `cm-ml-distdeps-*` meta-packages must be also removed from all compute nodes that are to run machine learning applications. For example, if the name of the software image is `gpu-image`, then the images directory is `/cm/images/gpu-image`, and then the administrator can remove `cm-ml-distdeps-cuda11.2` from the image as follows in RHEL 7:

**Example**

```
[root@bright92 ~]# yum remove --installroot=/cm/images/gpu-image cm-ml-distdeps-cuda11.2
```

The preceding command must be applied to all software images that are used to run the machine learning applications.

The equivalents to the `--installroot` option of `yum` for the other distribution package managers are described in section 1.4.
Running TensorFlow

This chapter goes through some example runs with TensorFlow. Some output messages have been removed or simplified in the runs for readability.

The sample runs assume that the GPU drivers are in place (section 7.4.1 of the Installation Manual). The runs also assume that TensorFlow package and the TensorFlow extras package have both been installed from the NVIDIA Bright Cluster Manager repository with a package manager.

TensorFlow can be installed, for example with

```
yum install cm-tensorflow2-py39-cuda11.2-gcc9 cm-tensorflow2-extra-py39-cuda11.2-gcc9
```

In addition to requiring the extras package, TensorFlow requires an OpenMPI implementation to work. Chapter 3 of the User Manual describes the different OpenMPI packages that the Bright repositories provide. The different OpenMPI packages allow the user to choose which one to use. For example, depending on which interconnect is being used, or depending on if CUDA support is required.

In this chapter, the `cm-openmpi4-cuda11.2-ofed51-gcc9` package is used. It can be installed with, for example:

```
yum install cm-openmpi4-cuda11.2-ofed51-gcc9
```

More information on the examples can be found at https://github.com/tensorflow/examples.

2.1 Hello World

A "Hello World" interactive example, that just shows that the software is in place for TensorFlow, can be run as follows:

Example

```
[root@bright92 ~]# module load shared
[root@bright92 ~]# module load tensorflow2-py39-cuda11.2-gcc9
Loading tensorflow2-py39-cuda11.2-gcc9/2.7.0
Loading requirement: openblas/dynamic/0.3.18 hdf5_18/1.8.21 gcc9/9.5.0 python39 \\
protobuf3-gcc9/3.9.2 ncc12-cuda11.2-gcc9/2.14.3
[root@bright92 ~]# module load openmpi4-cuda11.2-ofed51-gcc9/
Loading openmpi4-cuda11.2-ofed51-gcc9/4.1.4
Loading requirement: hpcx/mlnx-ofed51/2.7.4 ucrx/1.10.1 cm-pmix3/3.1.4 hwloc/1.11.11
[root@bright92 ~]# python3.9
Python 3.9.16 (main, Mar 16 2023, 14:03:52)
[GCC 11.2.0] on linux
Type "help", "copyright", "credits" or "license" for more information.
```
>>> import tensorflow as tf
...
>>> hello = tf.constant('TensorFlow 2 Hello World')
...
2023-03-22 17:20:10.514379: I tensorflow/core/common_runtime/gpu/gpu_device.cc:1525] Created \ndevice /job:localhost/replica:0/task:0/device:GPU:0 with 31002 MB memory: -> device: 0, name:

>>> hello = tf.constant('TensorFlow 2 Hello World')
>>> tf.print(hello)
TensorFlow 2 Hello World
>>> a = tf.constant(10)
>>> b = tf.constant(32)
>>> tf.print(a+b)
42

2.2 Deep Convolutional Generative Adversarial Network

The following trains a deep convolutional generative adversarial network (DCGAN).

The example code is included in the TensorFlow extras package. Once its module has been loaded, the example directory is defined with the CM_TENSORFLOW2_EXTRA environment variable.

The example picks up training images and labels from the MNIST site, and places them in a directory tensorflow_datasets/ if it needs to. The images are then used to train the model. End users would be expected to train the neural network within their home directories.

Example

[root@bright92 ~]# module load tensorflow2-extra-py39-cuda11.2-gcc9
Loading tensorflow2-extra-py39-cuda11.2-gcc9/2.7.0
Loading requirement: openblas/dynamic/0.3.18 hdf5_18/1.8.21 gcc9/9.5.0 python39 \nprotbuf3-gcc9/3.9.2 nccl2-cuda11.2-gcc9/2.14.3
tensorflow2-py39-cuda11.2-gcc9/2.7.0 opencv4-py39-cuda11.2-gcc9/4.5.4
[root@bright92 ~]# module load openmpi4-cuda11.2-ofed51-gcc9/
Loading requirement: hpcx/mlnx-ofed51/2.7.4 ucr/1.10.1 cm-pmix3/3.1.4 hwloc/1.11.11
[root@bright92 ~]# cd $(CM_TENSORFLOW2_EXTRA)/tensorflow_examples/models/dcgan/
[root@bright92 dcgan]# python3.9 dcgan.py --epochs 5
...

Dataset mnist downloaded and prepared to /root/tensorflow_datasets/mnist/3.0.1. Subsequent calls will reuse this data.
2.3 Image-to-Image Translation with Conditional Adversarial Nets

The following trains a conditional adversarial networks as a general-purpose solution to image-to-image translation problems. The trained model is capable of completing different tasks, such as colorizing black and white photos.

The example code is included in the TensorFlow extras package. Once its module has been loaded, the example directory is defined with the `CM_TENSORFLOW2_EXTRA` environment variable.

The example uses a preprocessed copy of the CMP Facade Database, helpfully provided by the Center for Machine Perception at the Czech Technical University in Prague. The original dataset includes 606 rectified images of facades from various sources, which have been manually annotated. The facades are from different cities around the world and diverse architectural styles.

The example conveniently downloads the dataset in a temporary directory and then trains the model. End users would be expected to train the neural network within their home directories.

Example

```
[root@bright92 ~]# module load tensorflow2-extra-py39-cuda11.2-gcc9
[root@bright92 ~]# module load openmpi4-cuda11.2-ofed51-gcc9/
[root@bright92 ~]# cd ${CM_TENSORFLOW2_EXTRA}/tensorflow_examples/models/pix2pix
[root@bright92 pix2pix]# python3.9 data_download.py --download_path /tmp
... Downloading data from http://efrosgans.eecs.berkeley.edu/pix2pix/datasets/facades.tar.gz
...
[root@bright92 pix2pix]# python3.9 pix2pix.py --path /tmp/facades --epochs 5
...
```

```
name: Tesla V100-SXM3-32GB, pci bus id: 0000:00:06.0, compute capability: 7.0
Training ...
```

Datasets generated by the preceding run can be purged with:

Example

```
[root@bright92 dcgan]# rm -rf /root/tensorflow_datasets/
```
2.4 Neural Machine Translation With Attention

The following trains a sequence to sequence model for neural machine translation with attention using gated recurrent units (GRUs).

The example code is included in the TensorFlow extra package. Once its module has been loaded, the example directory is defined with the `CM_TENSORFLOW2_EXTRA` environment variable.

The example conveniently downloads a dataset for Spanish to English translation in a temporary directory and then trains the model. End users would be expected to train the neural network within their home directories.

Example

```
[root@bright92 ~]# module load tensorflow2-extra-py39-cuda11.2-gcc9
[root@bright92 ~]# module load openmpi4-cuda11.2-ofed51-gcc9
[root@bright92 ~]# cd ${CM_TENSORFLOW2_EXTRA}/tensorflow_examples/models/nmt_with_attention/
[root@bright92 nmt_with_attention]# python3.9 train.py --epochs 5 --download_path /tmp
... Downloading data from http://storage.googleapis.com/download.tensorflow.org/data/spa-eng.zip ...

[root@bright92 nmt_with_attention]#
```
Running PyTorch

This chapter goes through some example runs with PyTorch. Some output messages have been removed or simplified in the runs for readability.

The sample runs assume that PyTorch and its extra libraries have been installed from the NVIDIA Bright Cluster Manager repository with a package manager. For example with:

```bash
yum install cm-pytorch-py37-cuda10.2-gcc8 cm-pytorch-extra-py37-cuda10.2-gcc8
```

In addition to requiring the extra libraries, PyTorch requires an OpenMPI implementation to work. Chapter 3 of the User Manual describes the different OpenMPI packages that the Bright repositories provide. The different OpenMPI packages allow the user to choose which one to use. For example, depending on which interconnect is being used, or depending on if CUDA support is required.

In this chapter, the `cm-openmpi4-cuda10.2-ofed50-gcc8` package is used.

More information on the examples can be found at https://github.com/pytorch/examples.

### 3.1 Variational Autoencoders

The following example shows how to train Variational Autoencoders, powerful generative models that can be used for a wide variety of applications.

The example code is included in the PyTorch extra (`cm-pytorch-extra-*`) package. Once its module has been loaded, the example directory is defined with the `CM_PYTORCH_EXTRA` environment variable.

**Example**

```bash
[root@bright92 ~]# module load shared
[root@bright92 ~]# module load pytorch-extra-py37-cuda10.2-gcc8
[root@bright92 ~]# module load openmpi4-cuda10.2-ofed50-gcc8
[root@bright92 ~]# cd ${CM_PYTORCH_EXTRA}/vae
```

The Variational Autoencoders network is trained by default for 10 epochs. The required dataset can automatically be downloaded and extracted with:

**Example**

```bash
[root@bright92 vae]# python3.7 main.py
```

... Processing... Done!
Train Epoch: 1 [0/60000 (0%)] Loss: 550.187805
Train Epoch: 1 [1280/60000 (2%)] Loss: 323.104736
Train Epoch: 1 [2560/60000 (4%)] Loss: 237.460938
...
Train Epoch: 1 [58880/60000 (98%)] Loss: 130.540909
====> Epoch: 1 Average loss: 164.1742
====> Test set loss: 127.8219
Train Epoch: 2 [0/60000 (0%)] Loss: 127.949753
...
Train Epoch: 10 [58880/60000 (98%)] Loss: 107.980888
====> Epoch: 10 Average loss: 106.1472
====> Test set loss: 105.8715

The output sampled digits can be found in the results directory:

[root@bright92 vae]# ls results/
